## NH<sub>3</sub> Saturation Curves 200 deg 300 deg 370 deg Co 2p Intensity (cts/s) NH<sub>3</sub> dose time (s)

Figure 1: Ammonia plasma saturation curves for a  $COCP_2/NH_3$  PE-ALD process for three temperatures; 200, 300 and 370 °C. The intensity of the Co 2p was obtained from area-under-curve calculations from the X-ray photoelectron spectroscopy (XPS) spectra. ALD growth rate of the CoN films decreases with increasing temperature. Additionally, the growth rate is inhibited for large  $NH_3$  plasma dose times at all temperatures.
