

NAMBE & QME 2023 Program Key

GD	MBE-Grown Devices
NM	Novel Materials
QME	Workshop on Quantum Materials Epitaxy
ST	Science and Technology of MBE

Key to Session/Paper Numbers

Sessions are labeled with acronyms (e.g. **QME, NM, etc.**), then a dash followed by the first two characters of the day of the week: **Saturday, Sunday, Monday, Tuesday, Wednesday**, then a single letter for **Morning, Afternoon, Poster**, and finally a number indicating the starting time slot for the paper.
Example: GD-MoA1-1 (Photonic Devices Session, Monday Afternoon, 1:30 pm).

NAMBE & QME 2023 Program Overview

Room /Time	BALLROOM A	HALL OF IDEAS E-J
SaM	QME-SaM1: Oxides I QME-SaM2: Topological and Magnetic Materials I	
SaA	QME-SaA1: 2D and Heteroepitaxial Integration QME-SaA2: Poster Highlights	
SaP	QME POSTER SESSION	
SuM	QME-SuM1: Oxides II QME-SuM2: Topological and Magnetic Materials II	
MoM	NM-MoM1: Oxide Semiconductors NM-MoM2: Nitrides	
MoA	GD-MoA1: Photonic Devices NM-MoA2: Strong Spin-Orbit Oxides	
MoP		NAMBE POSTER SESSIONS
TuM	NM-TuM1: Novel Materials, Optoelectronics NM-TuM2: Thin Film Membranes	
TuA	GD-TuA1: Solar Cell and Quantum Computing NM-TuA2: Novel Oxides and Superconductors	
WeM	ST-WeM1: Advancement in MBE Growth Approaches ST-WeM2: Fundamentals of MBE Growth	
WeA	NM-WeA: Low Dimensional and Topological Materials	

Saturday Morning, September 16, 2023

Room Ballroom A		
8:00am	INVITED: QME-SaM1-2 Hunting for New Oxide Superconductors using MBE, <i>Darrell Schlom</i> , Cornell University	Workshop on Quantum Materials Epitaxy Session QME-SaM1 Oxides I Moderator: Bharat Jalan , University of Minnesota
8:15am		
8:30am	INVITED: QME-SaM1-4 Advanced Epitaxial Growth of Quantum Materials Using Thermal Laser Epitaxy, <i>Jochen Mannhart</i> , Max Planck Institute for Solid State Research, Germany	
8:45am		
9:00am	INVITED: QME-SaM1-6 Superconductivity at Interfaces of KTaO_3 and its Possible Origins, <i>Anand Bhattacharya</i> , Argonne National Laboratory	
9:15am		
9:30am	INVITED: QME-SaM1-8 Synthesis of Electronic-Grade Quantum Heterostructures by Hybrid PLD, <i>Chang-Beom Eom</i> , University of Wisconsin-Madison	
9:45am		
10:00am	BREAK	
10:15am		
10:30am	INVITED: QME-SaM2-12 Invited Paper, <i>Stuart Parkin</i> , Max Planck Institute of Microstructural Physics, Germany	Workshop on Quantum Materials Epitaxy Session QME-SaM2 Topological and Magnetic Materials I Moderator: Nitin Samarth , Pennsylvania State University
10:45am		
11:00am	INVITED: QME-SaM2-14 The Art and Science of Molecular Beam Epitaxy — from Topological Materials to Interfacial Superconductivity, <i>Cui-Zu Chang</i> , Pennsylvania State University	
11:15am		
11:30am	INVITED: QME-SaM2-16 Epitaxial Control of Topological Semimetals, <i>Kirstin Alberi</i> , National Renewable Energy Laboratory	
11:45am		
12:00pm	INVITED: QME-SaM2-18 Growth and Investigations of Topological and Quantum Phenomena in Epitaxial Semimetallic Thin Films, <i>Chris Palmstrøm</i> , University of California, Santa Barbara	
12:15pm		

Saturday Afternoon, September 16, 2023

Room Ballroom A	
2:00pm	INVITED: QME-SaA1-1 Invited Paper, <i>Grace Xing</i> , Cornell University
2:15pm	
2:30pm	INVITED: QME-SaA1-3 Growth of Topological Materials by Molecular Beam Epitaxy, <i>Stephanie Law</i> , Pennsylvania State University
2:45pm	
3:00pm	INVITED: QME-SaA1-5 Big Flat Quantum Crystals: Wafer-Scale Growth of 2D Materials by Metalorganic Chemical Vapour Deposition, <i>James A. Gupta</i> , University of Ottawa, Canada
3:15pm	
3:30pm	INVITED: QME-SaA1-7 Advanced Heterogeneous Integration Enabled by Remote Epitaxy, <i>Jeehwan Kim</i> , Massachusetts Institute of Technology
3:45pm	
4:00pm	BREAK
4:15pm	
4:30pm	QME-SaA2-11 Poster Highlights Session - 3-Minute Oral Presentations from Poster Presenters,
4:45pm	
5:00pm	
5:15pm	

**Workshop on Quantum Materials Epitaxy
Session QME-SaA1
2D and Heteroepitaxial Integration
Moderator:
Roman Engel-Herbert, Paul Drude Institute, Germany**

**Workshop on Quantum Materials Epitaxy
Session QME-SaA2
Poster Highlights
Moderator:
Jason Kawasaki, University of Wisconsin - Madison**

Workshop on Quantum Materials Epitaxy

Room Ballroom A - Session QME-SaP

Workshop on Quantum Materials Epitaxy Poster Session

5:30 – 7:00 pm

QME-SaP-1 Optimization of Hybridized InAsSb/InGaSb Semiconductor Topological Materials, **Heather Haugan**, Air Force Research Laboratory; **D. Das**, L. Ram-Mohan, Worcester Polytechnic Institute; **J. Corbett**, **K. Mahalingam**, **R. Bedford**, **K. Eyink**, Air Force Research Laboratory

QME-SaP-2 Doping the Undopable: Hybrid Molecular Beam Epitaxy Growth, n-type Doping, and Field-Effect Transistor using CaSnO_3 , **Fengdeng Liu**, University of Minnesota, USA; **P. Golani**, University of Minnesota; **T. Truttman**, University of Minnesota, USA; **I. Evangelista**, University of Delaware; **M. Smeaton**, Cornell University; **D. Bugallo**, Drexel University; **J. Wen**, University of Minnesota; **A. Kamath Manjeshwar**, University of Minnesota, USA; **S. May**, Drexel University; **L. Kourkoutis**, Cornell University; **A. Janotti**, University of Delaware; **S. Koester**, University of Minnesota; **B. Jalan**, University of Minnesota, USA

QME-SaP-3 Solid Source Metal-Organic Molecular Beam Epitaxy for Epitaxial SrRuO_3 Films, **Anusha Kamath Manjeshwar**, **S. Nair**, **A. Rajapitamahuni**, **R. James**, **B. Jalan**, University of Minnesota

QME-SaP-4 Growth Mechanism of SrTiO_3 on a Graphene-covered Substrate using Hybrid MBE, **SooHo Choo**, **H. Yoon**, University of Minnesota, USA, Republic of Korea; **B. Matthews**, Pacific Northwest National Laboratory; **S. Sharma**, University of Minnesota, USA; **S. Spurgeon**, **S. Chambers**, Pacific Northwest National Laboratory; **R. James**, **B. Jalan**, University of Minnesota, USA

QME-SaP-5 Growing Clean Crystals from “Dirty” Precursors in MBE, **Rashmi Choudhary**, University of Minnesota, USA; **Z. Liu**, **J. Cai**, **X. Xu**, **J. Chu**, University of Washington; **B. Jalan**, University of Minnesota, USA

QME-SaP-6 Growth of EuIn_2As_2 Thin Films by MBE: Towards Investigating the Topological Properties of a Candidate Axion Insulator, **Muhsin Abdul Karim**, University of Notre Dame, Ghana; **J. Wang**, University of Notre Dame, China; **K. Yoshimura**, University of Notre Dame, Japan; **S. Bac**, University of Notre Dame, Korea (Democratic People's Republic of); **X. Liu**, University of Notre Dame, China; **B. Assaf**, University of Notre Dame

QME-SaP-7 Synthesis of Free-Standing Membranes Using a Sacrificial Layer Method Grown by Hybrid MBE, **Shivasheesh Varshney**, **S. Choo**, **Z. Yang**, **J. Wen**, **S. Koester**, **B. Jalan**, University of Minnesota, USA

QME-SaP-8 Epitaxial Growth of Precursor Phases of Novel Cuprate Superconductors Using Oxide MBE, **Jinkwon Kim**, **C. Kim**, **D. Schlom**, Cornell University

QME-SaP-9 MBE of $\text{Ba}_2\text{BiTaO}_6$, a Candidate p-type Oxide Semiconductor, **Anna Park**, **Y. Birkhölzer**, **M. Barone**, **D. Schlom**, Cornell University

QME-SaP-10 Flexomagnetism and Strain Induced Superconductivity in Rippled GdAuGe Heusler Membranes, **Tamalika Samanta**, **Z. LaDuca**, **D. Du**, **T. Jung**, **S. Manzo**, **K. Su**, **M. Arnold**, **J. Kawasaki**, University of Wisconsin - Madison

QME-SaP-11 Engineering Metal Oxidation Towards Epitaxial Growth of Complex Iridates using Molecular Beam Epitaxy, **Sreejith Nair**, **Z. Yang**, **D. Lee**, **S. Guo**, University of Minnesota, USA; **J. Sadowski**, Brookhaven National Laboratory; **S. Johnson**, Auburn University; **A. Saboor**, University of Delaware; **Y. Li**, **H. Zhou**, Argonne National Laboratory, USA; **R. Comes**, **W. Jin**, Auburn University; **K. Mkhoyan**, University of Minnesota, USA; **A. Janotti**, University of Delaware; **B. Jalan**, University of Minnesota, USA

QME-SaP-12 Improved Epitaxy of Unconventional Metals for Quantum Applications, **Stefania Isceri**, **M. Giparakis**, **R. Svagera**, **M. Waas**, Technische Universität Wien, Austria; **V. Butera**, **E. Kolibalova**, **O. Man**, Central European Institute of Technology, Czechia; **L. Fischer**, **H. Detz**, **W. Schrenk**, **G. Strasser**, **S. Buehler-Paschen**, **A. Andrews**, Technische Universität Wien, Austria

QME-SaP-13 Growth and Angle-Resolved Photoemission of Strain-and Thickness-Tuned α -Sn Films, **Aaron Engel**, **C. Dempsey**, **H. Inbar**, **S. Nishihaya**, **Y. Chang**, University of California, Santa Barbara; **A. Fedorov**, Advanced Light Source, Lawrence Berkeley National Laboratory; **M. Hashimoto**, **D. Lu**, SLAC National Accelerator Laboratory; **P. Taylor**, **P. Folkes**, US Army Research Laboratory; **C. Palmstrøm**, University of California, Santa Barbara

QME-SaP-14 Electrostatic Gating of SrSnO_3 Thin Films with Improved Mobilities, **Zhifei Yang**, **F. Liu**, **T. Truttman**, **B. Jalan**, University of Minnesota, USA

QME-SaP-15 Epitaxial Growth and Transport Properties of Square-Net Rare Earth Telluride Thin Films, **Adrian Llanos**, **J. Falson**, California Institute of Technology

QME-SaP-16 Improving MBE $(\text{Bi,Sb})_2(\text{Te,Se})_3$ Topological Materials Via Resonant and Magnetic Dopants, **Patrick Taylor**, Army Research Laboratory

QME-SaP-17 Growth of Cd_3As_2 on $\text{GaAs}(001)$, $\text{GaAs}(110)$, and $\text{Si}(001)$ Substrates, **Anthony Rice**, **I. Leahy**, **A. Norman**, **K. Alberi**, National Renewable Energy Laboratory

QME-SaP-18 Molecular Beam Epitaxy of Superconducting ZrN Thin Films on GaN Substrates, **Kevin D. Vallejo**, **D. Hurley**, **K. Gofryk**, **B. May**, Idaho National Laboratory

QME-SaP-19 Quasi Van Der Waals Epitaxy of Magnetic Topological Insulators on a GaAs (111) Substrate, **Yuxing Ren**, University of California at Los Angeles; **L. Tai**, 404 Westwood Plaza, Engineering VI, 310; **K. Pan**, **S. Srivastava**, **Y. Xie**, **M. Goorsky**, **K. Wang**, University of California at Los Angeles

QME-SaP-20 Transforming Rotating RHEED Data for Post-Growth Characterization Using Automated Machine Learning, **Chris Price**, Atomic Data Sciences

Sunday Morning, September 17, 2023

Room Ballroom A			
8:30am	INVITED: QME-SuM1-3 Design of Quantum Oxide Heterostructures, <i>Nini Pryds</i> , Technical University of Denmark	Workshop on Quantum Materials Epitaxy Session QME-SuM1 Oxides II Moderator: Julia Mundy, Harvard University	
8:45am			
9:00am	INVITED: QME-SuM1-5 Interfacial Phenomena in 4d and 5d Transition Metal Oxides Grown by Metal-organic MBE, <i>Ryan Comes</i> , Auburn University		
9:15am			
9:30am	INVITED: QME-SuM1-7 Investigating the Electronic Structure of Coupled Electric Fields at the Surface and Buried Interface of an Epitaxial Complex Oxide/Group IV Semiconductor Heterostructure, <i>Scott Chambers</i> , Pacific Northwest National Laboratory; <i>J. Ngai</i> , University of Texas at Arlington; <i>P. Sushko</i> , Pacific Northwest National Laboratory; <i>E. Ramirez</i> , University of Texas at Arlington; <i>T. Lee, D. Biswas</i> , Diamond Light Source, UK		
9:45am			
10:00am	BREAK		
10:15am			
10:30am	INVITED: QME-SuM2-11 Molecular Beam Epitaxy of Topological Semimetal Heterostructures, <i>Nitin Samarth</i> , Penn State University		Workshop on Quantum Materials Epitaxy Session QME-SuM2 Topological and Magnetic Materials II Moderator: Chris Palmstrøm, University of California, Santa Barbara
10:45am			
11:00am	INVITED: QME-SuM2-13 Controlling Magnetism in Layered Quantum Materials Through Designer Defects, <i>Matthew Brahlek</i> , Oak Ridge National Laboratory		
11:15am			
11:30am	INVITED: QME-SuM2-15 Epitaxy of Rare Earth Compounds on Atomically Flat Surfaces, <i>Joseph Falson</i> , Caltech		
11:45am			
12:00pm	INVITED: QME-SuM2-17 Reactive Force Field Simulations as Versatile Tool to Explore the Growth Kinetics in Molecular Beam Epitaxy of Quantum Materials at the Atomic Scale, <i>Roman Engel-Herbert</i> , Paul Drude Institute, Germany		
12:15pm			

Monday Morning, September 18, 2023

Room Ballroom A		
7:45am	Welcome and Sponsor Thank You's	Novel Materials Session NM-MoM1 Oxide Semiconductors Moderator: Bharat Jalan, University of Minnesota
8:00am	INVITED: NM-MoM1-2 Art Gossard MBE Innovator Awardee Talk: Setting a New Quality Standard for Both Holes and Electrons in GaAs Ultra-High Mobility Quantum Wells, Loren N. Pfeiffer , Princeton University	
8:15am		
8:30am	NM-MoM1-4 Silicon-doped β -Ga ₂ O ₃ Films Grown at 1 μ m/h by Suboxide Molecular-Beam Epitaxy, Kathy Azizie , F. Hensling , C. Gorsak , Cornell University; Y. Kim , Air Force Research Laboratory; N. Pieczulewski , Cornell University; D. Dryden , Air Force Research Laboratory; M. Senevirathna , S. Coye , Clark Atlanta University; S. Shang , Penn State University; J. Steele , P. Vogt , N. Parker , Y. Birkhölzer , Cornell University; Z. Liu , Penn State University; M. Williams , Clark Atlanta University; K. Chabak , Air Force Research Laboratory; D. Muller , Cornell University; A. Neal , S. Mou , Air Force Research Laboratory; D. Schlom , Cornell University	
8:45am	NM-MoM1-5 Improving Si Dopant Control in n-type β -Gallium Oxide, Brenton Noesges , Y. Kim , A. Neal , S. Mou , T. Asel , Air Force Research Laboratory, Materials and Manufacturing Directorate, USA	
9:00am	NM-MoM1-6 The Effect of Gallium Beam Flux on Electron Transport in β -Ga ₂ O ₃ Grown via Plasma Assisted Molecular Beam Epitaxy, Thaddeus Asel , B. Noesges , Y. Kim , A. Neal , S. Mou , Air Force Research Laboratory, Materials and Manufacturing Directorate	
9:15am	NM-MoM1-7 Growth of α -(Al _x Ga _{1-x}) ₂ O ₃ by Suboxide Molecular-Beam Epitaxy, Jacob Steele , K. Azizie , N. Pieczulewski , J. McCandless , Cornell University; I. Matara Kankanamge , M. D. Williams , Clark Atlanta University; H. Xing , D. Jena , D. Muller , Cornell University; T. Onuma , Kogakuin University, Japan; D. Schlom , Cornell University (USA) and Leibniz-Institut für Kristallzüchtung (Germany)	
9:30am	NM-MoM1-8 Electrostatic Gating of SrSnO ₃ Thin Films with Improved Mobilities, Zhifei Yang , F. Liu , T. Truttman , B. Jalan , University of Minnesota, USA	
9:45am	BREAK & EXHIBITS	
10:00am		
10:15am	NM-MoM2-11 Molecular Beam Epitaxy of Binary and Ternary Manganese and Chromium Nitrides, K. Vallejo , K. Gofryk , Idaho National Laboratory; S. Gutierrez-Ojeda , Universidad Nacional Autónoma de México; G. Cocoltzi , Benemérita Universidad Autónoma de Puebla, Mexico; Brelon May , Idaho National Laboratory	Novel Materials Session NM-MoM2 Nitrides Moderator: Lutz Geelhaar , Paul-Drude-Institut für Festkörperelektronik Leibniz-Institut im Forschungsverbund Berlin, Germany
10:30am	NM-MoM2-12 Achieving Atomically Ordered GaN/AlN Quantum Heterostructures: The Role of Surface Polarity, Yuanpeng Wu , P. Zhou , Y. Xiao , K. Sun , D. Wang , P. Wang , Z. Mi , University of Michigan, Ann Arbor	
10:45am	NM-MoM2-13 Epitaxial Cubic Boron Nitride Grown by Ion Beam-Assisted Molecular-Beam Epitaxy on Diamond, David Storm , S. Maximenko , A. Lang , N. Nepal , T. Feygelson , B. Pate , D. Meyer , US Naval Research Laboratory	
11:00am	NM-MoM2-14 Optical Properties of ScN Layers Grown on Sapphire Using Plasma-Assisted Molecular Beam Epitaxy, Duc V. Dinh , Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungsverbund Berlin e.V., Germany; F. Peiris , Kenyon College; J. Lähnemann , O. Brandt , Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungsverbund Berlin e.V., Germany	
11:15am	NM-MoM2-15 Epitaxial Growth of High ScN Fraction ScAlN on NbN and SiC, Matthew Hardy , A. Lang , E. Jin , N. Nepal , B. Downey , V. Gokhale , S. Katzer , V. Wheeler , U.S. Naval Research Laboratory	
11:30am	NM-MoM2-16 High Efficiency Micrometer Scale Green and Red Light Emitting Diodes, Yixin Xiao , R. Maddaka , Y. Wu , Y. Malholtra , Y. Guo , S. Yang , J. Liu , K. Sun , A. Pandey , J. Min , Z. Mi , University of Michigan	
11:45am	NM-MoM2-17 AlN/AlGaIn Short Period Superlattices With Sub 2 nm Layers Grown by MME, Alexander Chaney , Azimuth Corporation; C. Bowers , K. Mahalingam , UES INC; S. Mou , K. Averett , T. Asel , Air Force Research Laboratory, Materials and Manufacturing Directorate, USA	

Monday Afternoon, September 18, 2023

Room Ballroom A		
1:30pm	GD-MoA1-1 Separate Absorption, Charge, and Multiplication Avalanche Photodiodes With InGaAs/GaAsSb Type-II Superlattices Grown by Molecular Beam Epitaxy, Hyemin Jung , S. Lee, The Ohio State University; X. Jin, Y. Liu, University of Sheffield, UK; T. Ronningen, The Ohio State University; C. Grein, University of Illinois at Chicago; J. David, University of Sheffield, UK; S. Krishna, The Ohio State University	MBE-Grown Devices Session GD-MoA1 Photonic Devices Moderator: Minjoo Larry Lee, University of Illinois Urbana-Champaign
1:45pm	GD-MoA1-2 Growth of MWIR ICLEDs on Silicon using Molecular Beam Epitaxy, Mega Frost , T. Rotter, F. Ince, G. Balakrishnan, University of New Mexico; M. McCartney, D. Smith, Arizona State University; C. Canedy, W. Bewley, S. Tomasulo, C. Kim, U.S. Naval Research Laboratory; M. Kim, Jacobs Corporation; I. Vurgaftman, J. Meyer, U.S. Naval Research Laboratory	
2:00pm	GD-MoA1-3 Monolithic Integration of InAs Quantum Dot Lasers with Silicon Photonic Waveguides, Alec Skipper , K. Feng, University of California Santa Barbara; G. Leake, J. Herman, SUNY POLY, Albany; C. Shang, R. Koszica, University of California Santa Barbara; D. Harame, SUNY POLY, Albany; J. Bowers, University of California Santa Barbara	
2:15pm	GD-MoA1-4 Reducing Threading Dislocation Density of Pocket-Grown InAs Quantum Dot Lasers on Patterned SiO ₂ /Si, Rosalyn Koszica , C. Shang, K. Feng, J. Bowers, University of California Santa Barbara	
2:30pm	GD-MoA1-5 MBE Growth of Near-Infrared Heterojunction Phototransistors and Visible LEDs for Night Vision Applications, David Montealegre , University of Illinois at Urbana Champaign; Y. Song, Yale University; S. Lee, University of Washington; B. Kim, M. Kim, University of Illinois at Urbana Champaign; F. Xia, Yale University; M. Li, A. Majumdar, University of Washington; M. Lee, University of Illinois at Urbana Champaign	
2:45pm	GD-MoA1-6 Optically-Addressed Monolithically-Integrated Multi-band Photodetectors Using Type-II Superlattice Materials, Zheng Ju , X. Qi, A. McMinn, Y. Zhang, Arizona State University	
3:00pm	BREAK & EXHIBITS	
3:15pm		
3:30pm	NM-MoA2-9 Atomic Scale Modeling of the Hybrid Molecular Beam Epitaxy Growth Process Using Reactive Force Field Simulations, B. Yalcin, D. Yilmaz, A. van Duin, Pennsylvania State University; Roman Engel-Herbert , Pennsylvania State University, USA, Paul-Drude-Institute for Solid State Electronics, Berlin, Germany	Novel Materials Session NM-MoA2 Strong Spin-Orbit Oxides Moderator: Ryan Comes, Auburn University
3:45pm	NM-MoA2-10 Engineering Metal Oxidation Towards Epitaxial Growth of Complex Iridates using Molecular Beam Epitaxy, Sreejith Nair , Z. Yang, D. Lee, S. Guo, University of Minnesota, USA; J. Sadowski, Brookhaven National Laboratory; S. Johnson, Auburn University; A. Saboor, University of Delaware; Y. Li, H. Zhou, Argonne National Laboratory; R. Comes, W. Jin, Auburn University; K. Mkhoyan, University of Minnesota, USA; A. Janotti, University of Delaware; B. Jalan, University of Minnesota, USA	
4:00pm	NM-MoA2-11 Solid Source Metal-Organic Molecular Beam Epitaxy for Epitaxial SrRuO ₃ Films, Anusha Kamath Manjeshwar , S. Nair, A. Rajapitamahuni, R. James, B. Jalan, University of Minnesota	
4:15pm	NM-MoA2-12 Growth of Ruddlesden-Popper Ruthenates via Thermal Laser Epitaxy, Brendan D. Faeth , F. Hensling, V. Harbola, L. Majer, Max Planck Institute for Solid State Research, Germany; H. Boschker, Epiray GMBH, Germany; W. Braun, J. Mannhart, Max Planck Institute for Solid State Research, Germany	
4:30pm	NM-MoA2-13 Growing Clean Crystals from "Dirty" Precursors in MBE, Rashmi Choudhary , University of Minnesota, USA; Z. Liu, J. Cai, X. Xu, J. Chu, University of Washington; B. Jalan, University of Minnesota, USA	
4:45pm	NM-MoA2-14 MBE Growth of BaCo ₂ Ru ₄ O ₁₁ : A Metallic Ferromagnetic Hexaferrite, Yilin Evan Li , Department of Materials Science and Engineering, Cornell University; M. Brützmam, Leibniz-Institut für Kristallzüchtung, Germany; R. Cava, Department of Chemistry, Princeton University; C. Gugushev, Leibniz-Institut für Kristallzüchtung, Germany; D. Schlom, Department of Materials Science and Engineering, Cornell University	
5:00pm	NM-MoA2-15 Hybrid Molecular Beam Epitaxy of SrIrO ₃ Films and Heterostructures, Gaurab Rimal , T. Tasnim, J. Ahammad, Auburn University; G. Sterbinsky, Argonne National Lab; J. Sadowski, Brookhaven National Laboratory; M. Boebinger, Oak Ridge National Laboratory; R. Comes, Auburn University	

MBE-Grown Devices

Room Hall of Ideas E-J - Session GD-MoP

MBE-Grown Devices Poster Session

5:15 – 7:00 pm

GD-MoP-2 Parity-Time Symmetry Single-Mode Double-Microdisk InGaAs Quantum Dot Lasers, *K. Lin, C. Xu, Tsong-Sheng Lay*, National Chung Hsing University, Taiwan

GD-MoP-3 Impact Ionization Coefficients of Al_xGa_{1-x}AsSb (x=0 – 1) Lattice Matched to InP Substrates, *Seunghyun Lee*, The Ohio State University; *X. Jin*, University of Sheffield, UK; *H. Jung*, The Ohio State University; *J. David*, University of Sheffield, UK; *S. Krishna*, The Ohio State University

GD-MoP-4 Superconducting Germanium for Scalable Qubit Architectures, *Patrick Strohbeen*, *A. Brook*, *J. Shabani*, Center for Quantum Information Physics, New York University

GD-MoP-5 Epitaxial Growth of High-Quality Aluminum Thin Films via MBE for the Experimental Realization of Majorana Bound States, *A. Elbaroudy*, *B. Khromets*, *E. Bergeron*, *T. Blaikie*, *Y. Shi*, *A. Tam*, *S. Sadeghi*, *F. Sfigakis*, *Zbig Wasilewski*, *J. Baugh*, University of Waterloo, Canada

GD-MoP-6 Submicron-Scale Light Emitting Diode with Efficient and Robust Red Emission, *Yixin Xiao*, *R. Maddakka*, University of Michigan, Ann Arbor

GD-MoP-7 Impact of Built-in Electric Field Direction on Performance of GaN-Based Laser Diodes, *Henryk Turski*, Institute of High Pressure Physics PAS, Poland; *L. van Deurzen*, Cornell University; *M. Hajdel*, *M. Chlipala*, *M. Zak*, *G. Muziol*, *C. Skierbiszewski*, Institute of High Pressure Physics PAS, Poland

GD-MoP-8 Demonstration of a 4.32 μm Cutoff InAsSbBi nBn Photodetector, a Lattice-matched Random Alloy III-V Solution for Mid-wave Infrared Sensing, *Preston T. Webster*, *J. Logan*, *L. Helms*, *P. Grant*, *C. Hains*, *R. Carrasco*, *A. Newell*, Air Force Research Laboratory, Space Vehicles Directorate; *M. Milosavljevic*, *S. Johnson*, Arizona State University; *G. Balakrishnan*, University of New Mexico; *D. Maestas*, *C. Morath*, Air Force Research Laboratory, Space Vehicles Directorate

GD-MoP-11 Zeeman Field-Induced Two-Dimensional Weyl Semimetal Phase in Cadmium Arsenide Thin Films, *Binghao Guo*, *W. Miao*, *V. Huang*, *A. Lygo*, University of California, Santa Barbara; *X. Dai*, University of Science and Technology, Hong Kong, China; *S. Stemmer*, University of California, Santa Barbara

GD-MoP-12 MBE Grown InAs/GaAs Quantum Dot Columns as a Buffer Layer for Spatial and Spectral Homogeneity, *Nazifa Tasnim Arony*, *L. McCabe*, *J. Zide*, University of Delaware

Novel Materials

Room Hall of Ideas E-J - Session NM-MoP

Novel Materials Poster Session

5:15 – 7:00 pm

NM-MoP-1 A Study of the Effect of Substrate Misorientation on the Strain Relaxation of InSb Grown on GaAs (001), *Trevor Blaikie*, *M. Tam*, *Y. Shi*, University of Waterloo, Canada; *A. Rahemtulla*, *N. Appathurai*, *B. Moreno*, Canadian Light Source, Inc., Canada; *Z. Wasilewski*, University of Waterloo, Canada

NM-MoP-2 2DEG Transport at the Interface of SrNbO₃/BaSnO₃, *Brian Opatosky*, *S. Thapa*, *T. Tasnim*, *G. Rimal*, *P. Gemperline*, Auburn University; *S. Mahatara*, New Mexico State University; *H. Paik*, University of Oklahoma; *R. Vukelich*, *M. Giri*, *D. Hilton*, Baylor University; *B. Kiefer*, New Mexico State University; *R. Comes*, Auburn University

NM-MoP-3 SrIrO₃ Films and Heterostructures Grown by Hybrid Molecular Beam Epitaxy, *Tanzila Tasnim*, Auburn University, Bangladesh; *G. Rimal*, *B. Opatosky*, Auburn University; *G. Sterbinsky*, Argonne National Laboratory; *M. Boebinger*, Oak Ridge National Laboratory; *R. Comes*, Auburn University

NM-MoP-4 Characterization of MBE Grown Fe_{0.75}Co_{0.25} in Composite Multiferroics, *Katherine Robinson*, Ohio State University; *M. Newburger*, *M. Page*, Air Force Research Laboratory; *R. Kawakami*, Ohio State University

NM-MoP-5 Multicolor Micrometer Scale Light Emitting Diodes Monolithically Grown on the Same Chip, *Yifu Guo*, *Y. Xiao*, *Y. Malholtra*, *Y. Wu*, *S. Yang*, *J. Liu*, *A. Pandey*, *Z. Mi*, University of Michigan

NM-MoP-6 Bismuth Surfactant Enhancement of Surface Morphology and Film Quality of Low-Temperature Grown GaSb, *Pan Menasuta*, *K. Grossklau*, *J. McElearney*, *T. Vandervelde*, Tufts University

NM-MoP-7 Study the Temperature Effect on the Stability and Performance of III-Nitride HEMT Based Magnetic Fields Sensors, *Satish Shetty*, Institute for Nanoscience and Engineering, University of Arkansas; *A. Kuchuk*, Institute for Nanoscience and Engineering, University of Arkansas; *H. Mantooh*, Department of Electrical Engineering, University of Arkansas; *G. Salamo*, Institute for Nanoscience and Engineering, University of Arkansas

NM-MoP-8 Optimization of Heteroepitaxial ZnGeN₂/GaN Quantum Wells for Green LEDs, *M. Miller*, Colorado School of Mines; *A. Rice*, National Renewable Energy Laboratory; *D. Diercks*, Colorado School of Mines; *A. Tamboli*, *Brooks Tellekamp*, National Renewable Energy Laboratory

NM-MoP-9 Machine Learning Analysis and Predictions of PAMBE III-Nitride Growth, *Andrew Messecar*, *S. Durbin*, *R. Makin*, Western Michigan University

NM-MoP-10 Tuning the Emission Wavelength by Varying the Sb Composition in InGaAs/GaAsSb W-quantum Wells Grown on GaAs(001) Substrates, *Z. Zou*, *S. Voranathamrong*, Department of Electrical Engineering, National Chung Hsing University, Taichung, Taiwan; *C. Cheng*, Department of Physics, National Central University, Chung-Li, Taiwan; *Z. Lee*, *T. Lo*, *C. Liu*, Department of Electrical Engineering, National Chung Hsing University, Taichung, Taiwan; *C. Chiang*, *L. Hung*, *M. Hsu*, Epileds Co., Ltd., Tainan, Taiwan; *W. Liu*, Department of Electrical Engineering, Yuan Ze University, Chung-Li, Taiwan; *J. Chyi*, Department of Electrical Engineering, National Central University, Chung-Li, Taiwan; *Charles Tu*, Department of Electrical Engineering, National Chung Hsing University, Taichung, Taiwan

NM-MoP-11 Strong Correlation in Two-Dimensional 1T- NbSe₂, *Joy Hsu*, *R. Bircmierz*, *M. Altvater*, *V. Madhavan*, University of Illinois at Urbana-Champaign

NM-MoP-12 Growth of Cobalt-containing Compounds for Back-End-of-Line Interconnects, *Yansong Li*, *G. Zhou*, *C. Hinkle*, University of Notre Dame

NM-MoP-13 Development of Al_xGa_{1-x}As_{1-y}Bi_y for the Next Generation of APDs, *Matthew Carr*, *N. Bailey*, University of Sheffield, UK; *M. Sharpe*, *J. England*, University of Surrey, UK; *R. Richards*, *J. David*, University of Sheffield, UK

NM-MoP-15 Epitaxial Growth of a-plane Mn₃Sn on c-plane Al₂O₃ using Molecular Beam Epitaxy, *Sneha Upadhyay*, *T. Erickson*, Ohio University; *J. Moreno*, Universidad Autonoma de Puebla, Mexico; *H. Hall*, Ohio University; *K. Sun*, University of Michigan, Ann Arbor; *G. Cocolezzi*, Universidad Autonoma de Puebla, Instituto de fisica, Mexico; *N. Takeuchi*, Centro de Nanociencias y Nanotecnología, Universidad Nacional Autonoma de México; *A. Smith*, Ohio University

NM-MoP-16 Surfactant Effect of Mn on AlN MBE Growth, *Jesús Fernando Fabian Jacobi*, *R. Trejo Hernández*, *A. Martínez López*, Nanoscience and Nanotechnology Program, Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), Mexico; *Y. Casallas Moreno*, CONACYT-Interdisciplinary Professional Unit in Engineering and Advanced Technologies, National Polytechnic Institute, Mexico; *I. Koudriavtsev*, Electrical Engineering Department, Solid State Electronic Section, Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), Mexico; *D. Olguin Melo*, Center for Research and Advanced Studies of the National Polytechnic Institute Querétaro Unit, Mexico; *S. Gallardo Hernández*, *M. López López*, Physics Department, Center for Research and Advanced Studies of the National Polytechnic Institute (CINVESTAV), Mexico

NM-MoP-17 Growth and Scattering Mechanisms of Metamorphic In_{0.81}Ga_{0.19}As Quantum Wells, *Jason Dong*, University of California at Santa Barbara; *Y. Gul*, University College London, UK; *A. Engel*, *C. Dempsey*, *S. Chatterjee*, University of California at Santa Barbara; *M. Pepper*, University College London, UK; *C. Palmstrøm*, University of California at Santa Barbara

NM-MoP-19 Light-enhanced Gating Effect at Conducting Interface of Laser MBE Grown EuO-KTO₃, *Manish Dumen*, *S. Chakraverty*, Institute of Nano Science and Technology, India

NM-MoP-20 4.3 μm InAs/AlSb Quantum Cascade Detector Strain-Balanced to a GaSb Substrate, *Stefania Isceri*, *M. Giparakis*, *W. Schrenk*, *B. Schwarz*, *G. Strasser*, *A. Andrews*, Technische Universität Wien, Austria

NM-MoP-21 Growth and Surface Investigation of Antiferromagnetic DO₁₉ – Mn₃Ga Thin Films on GaN (0001), *Ashok Shrestha*, *A. Abbas*, *D. Ingram*, *A. Smith*, Ohio University

NM-MoP-22 Guided Anisotropic Oxygen Transport in Vacancy Ordered Oxides, *Jeffrey Dhas*, *Y. Du*, Pacific Northwest National Laboratory

NM-MoP-23 Impact of Unintentional Sb in the Tensile Electron Well of Type-II InAs/InAsSb Superlattices Grown on GaSb by Molecular Beam Epitaxy, *Marko Milosavljevic*, Arizona State University; *P. Webster*, Air Force Research Laboratory; *S. Johnson*, Arizona State University

NM-MoP-24 Local Droplet Etching and Filling Behavior of Nanoholes in In_{0.52}Al_{0.48}As Layers, *Dennis Deutsch*, *V. Zolatanosha*, *C. Buchholz*, *K. Jöns*, *D. Reuter*, Paderborn University, Germany

NM-MoP-25 Heteroepitaxial growth of (111)-oriented SrTiO₃ on ScAlN/GaN, *E. Jin, A. Lang, B. Downey, V. Gokhale, Matthew Hardy, N. Nepal, S. Katzer, V. Wheeler*, Naval Research Laboratory

NM-MoP-26 Strain-Mediated Sn Incorporation and Segregation in Compositionally Graded Ge_{1-x}Sn_x Epilayers Grown by MBE at Different Temperature, **Nirosh M Eldose**, *H. Stanchu, S. Das, S. Shetty, C. Li, Y. I Mazur, S. Yu, G. J. Salamo*, University of Arkansas

NM-MoP-27 Growth and Characterization of GaAs (111) on 4H-SiC for Infrared Sensor, **Subhashis Das**, *N. M Eldose, H. Stanchu, F. Maia de Oliveira, C. Li, M. Benamara, Y. I. Mazur, G. Salamo*, University of Arkansas

NM-MoP-28 Growth and Conductivity Control of AlN by Plasma Assisted MBE, **Neeraj Nepal**, *M. Hardy, B. Downey, A. Lang, D. Katzer, E. Jin, D. Storm, V. Gokhale, T. Growden, D. Meyer, V. Wheeler*, U.S. Naval Research Laboratory

NM-MoP-29 Molecular Beam Epitaxy Grown Group-IV Alloys for Infrared Photodetector and Quantum Transport Applications, **Tyler McCarthy**, *Arizona State University; R. Basnet, University of Arkansas; Z. Ju, X. Qi, A. McMinn, Arizona State University; J. Hu, S. Yu, University of Arkansas; Y. Zhang, Arizona State University*

NM-MoP-30 Transport of Rare-Earth Nitrides Deposited via Molecular Beam Epitaxy, **Kevin Vallejo**, *Z. Hua, Y. Zhang, K. Gofryk, B. May*, Idaho National Laboratory

NM-MoP-31 High Al-Content AlGa_N Grown on TaC Virtual Substrates with Metallic Conductivity, **M. Brooks Tellekamp**, *D. Roberts*, National Renewable Energy Laboratory; *M. Miller*, Colorado School of Mines; *A. Rice*, National Renewable Energy Laboratory; *J. Hachtel*, Oak Ridge National Laboratory; *N. Haegel*, National Renewable Energy Laboratory

NM-MoP-32 Grafted AlGaAs/GeSn p-i-n Heterojunction for GeSn MIR Electrically Pumped Laser Application, **Yang Liu**, *J. Zhou, D. Vincent, J. Gong, S. Haessly, Y. Li, Q. Zhang*, University of Wisconsin - Madison; *S. Yu*, University of Arkansas; *Z. Ma*, University of Wisconsin - Madison

NM-MoP-34 Molecular Beam Epitaxy of Kagome-Structured Antiferromagnetic FeSn Grown on LaAlO₃ (111), **Tyler Erickson**, *S. Upadhyay, H. Hall, D. Ingram, S. Kaya, A. Smith*, Ohio University

NM-MoP-35 Tuning Interface Sharpness and Superconductivity at Oxide Heterostructures, **Y. Eren Suyolcu**, *Max Planck Institute for Solid State Research, Germany; G. Kim, Max Planck Institute for Solid State Research; Y. Wu, G. Logvenov, P. van Aken, Max Planck Institute for Solid State Research, Germany*

NM-MoP-37 Molecular Beam Epitaxial Growth of GaInAs, GaNAs and GaInNAs Nanowires over 2-inch Si(111) Substrate Showing Emission at Near Infrared Regime, **Keisuke Minehisa**, *H. Hashimoto, K. Nakama, F. Ishikawa*, Hokkaido University, Japan

NM-MoP-38 Tunable Superconductivity in Hybrid Interface FeTe_{1-x}Se_x/Bi₂Te₃ Grown by Molecular Beam Epitaxy, **An-Hsi (Jane) Chen**, *Oak Ridge National Laboratory, USA; Q. Lu, R. Moore, M. Brahlek*, Oak Ridge National Laboratory

NM-MoP-39 Van Der Waals Epitaxy of 2D Ferromagnetic Fe_{5-x}GeTe₂ Films with Curie Temperature Above Room Temperature on Graphene, **Joao Marcelo J. Lopes**, *H. Lv, A. Kassa, A. da Silva, J. Herfort, M. Hanke, A. Trampert, R. Engel-Herbert, M. Ramsteiner*, Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungverbund Berlin, Germany

NM-MoP-40 Molecular Beam Epitaxy of MnBi₂Te₄ and Bi₂Te₃/MnBi₂Te₄ Heterostructures, **Hyunsue Kim**, *University of Texas at Austin; M. Liu*, Harvard University; *L. Frammalino, Y. Li, F. Zhang*, University of Texas at Austin; *W. Lee*, University of Chicago; *X. Li, A. MacDonald, C. Shih*, University of Texas at Austin

NM-MoP-41 Effect of Spin-Orbit Field on the Magnetization Reversal in a Crystalline (Ga,Mn)(As,P) Ferromagnetic Layer, **Seongjin Park**, *K. Lee, S. Lee*, Korea University, Republic of Korea; *X. Liu*, University of Notre Dame; *M. Dobrowolska, J. Furdyna*, University of Notre Dame

NM-MoP-42 Unraveling the Role of Dopant Clustering in Magnetic Impurity Doped Monolayers of Transition Metal Dichalcogenides, **Rehan Younas**, *G. Zhou, C. Hinkle*, University of Notre Dame

NM-MoP-43 Atomic Layer Molecular Beam Epitaxy Growth of Kagome Ferrimagnet RMn₆Sn₆ (R = Rare Earth) Thin Films, **Shuyu Cheng**, *W. Zhou, R. Kawakami*, Ohio State University

NM-MoP-44 Investigating Phase Transformations and Stability of Pt-Te Van Der Waals Materials Through Pt Vapor Exposure and Post-Growth Annealing, **Kinga Lasek**, *Purdue University; University of South Florida*

NM-MoP-45 Layer-Dependent Optical Properties of MBE-Grown ZrTe₂ Determined by in-Situ Spectroscopic Ellipsometry, **E. Houser, Frank Peiris**, *Kenyon College; A. Richardella, M. Stanley, N. Samarth*, Pennsylvania State University

NM-MoP-46 Bi Heteroantites at Ga(As,Bi)/(Al,Ga)As Interface: Role of the Surface Reconstruction?, **Esperanza Luna**, *A. da Silva, K. Biermann*, Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungverbund Berlin e.V., Germany; *J. Puustinen, J. Hilska, M. Guina*, Optoelectronics Research Centre, Tampere University, Finland; *P. Laukkanen, M. Punkkinen*, University of Turku, Finland; *A. Trampert*, Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungverbund Berlin e.V., Germany

NM-MoP-47 Substrate Preparation Methods for the MBE Growth of Van Der Waals Materials, **Ryan Trice**, *M. Yu, A. Richardella, M. Hulse, S. Law*, Penn State University

NM-MoP-49 Comparison of the Optoelectronic Properties of InGaAs and GaAsSb Absorbers on InP for 1.55 μm Avalanche Photodiodes, **Nathan Gajowski**, *The Ohio State University; P. Webster*, Air Force Research Lab; *S. Lee*, The Ohio State University; *P. Grant*, Air Force Research Lab; *S. Krishna*, The Ohio State University

NM-MoP-50 Transmission Electron Microscopy Studies of the Formation of In₂Se₃ Layers via Selenium Passivation of InP(111)B Substrates, **Kaushini Wickramasinghe**, *C. Forrester*, City College of New York, City University of New York; *M. McCartney, D. Smith*, Arizona State University; *M. Tamargo*, City College of New York, City University of New York

Science and Technology of MBE

Room Hall of Ideas E-J - Session ST-MoP

Science and Technology of MBE Poster Session

5:15 – 7:00 pm

ST-MoP-1 Shadow Mask Molecular Beam Epitaxy, **Shagorika Mukherjee**, *S. Sitarum, X. Wang*, University of Delaware; *S. Law*, Penn State University

ST-MoP-2 Strain Relaxation of Graded InGa_N and AlGa_N, **Reem Alhelais**, *F. Mais de Oliveira, H. Stanchu, M. Sarollahi, Y. Mazur, N. Al-Hosainy, M. Ware*, University of Arkansas

ST-MoP-3 Improved N-Type Doping Activation in AlGaAs:Si Through Digital Alloy Growth, **Xizheng Fang**, *B. Kim, D. Montealegre, Y. Wang, A. Birge, M. Lee*, University of Illinois at Urbana Champaign

ST-MoP-4 Metal Contact Etch Process Optimization of Metal Contact Etching in 3D Integration Devices, **Sung Gyu Pyo**, *CAU, Republic of Korea*

Tuesday Morning, September 19, 2023

Room Ballroom A		
7:45am	Welcome and Sponsor Thank You	Novel Materials Session NM-TuM1 Novel Materials, Optoelectronics Moderator: Jason Kawasaki, University of Wisconsin - Madison
8:00am	INVITED: NM-TuM1-2 NAMBE Young Investigator Awardee Talk: Dislocation Dynamics in InGaSb Graded Buffers on GaSb Grown by MBE, <i>Stephanie Tomasulo, M. Twigg, S. Maximenko, I. Vurgaftman, J. Nolde</i> , U.S. Naval Research Laboratory	
8:15am		
8:30am	NM-TuM1-4 Emergent Ferromagnetism in Altermagnetic Candidate MnTe Films Grown on InP (111), <i>Matthew Brahlek</i> , Oak Ridge National Laboratory	
8:45am	NM-TuM1-5 Growth Parameters Impact on Electronic and Optical Properties of ErAs:InGaAlBiAs Materials, <i>Wilder Acuna, W. Wu, J. Bork, M. Jungfleisch, L. Gundlach, J. Zide</i> , University of Delaware	
9:00am	NM-TuM1-6 Heteroepitaxial Growth of Site-determined Quantum Emitters in 2D GaSe Films, <i>Mingyu Yu</i> , University of Delaware; <i>S. Law</i> , Pennsylvania State University	
9:15am	NM-TuM1-7 Evaluating (001) and (111)A InAs Quantum Emitters at Telecommunication Wavelengths Grown by Droplet Epitaxy, <i>Margaret Stevens</i> , US Naval Research Laboratory; <i>W. McKenzie, G. Baumgartner</i> , Laboratory for Telecommunication Sciences; <i>J. Grim, A. Bracker</i> , US Naval Research Laboratory	
9:30am	NM-TuM1-8 Growth of InSb Quantum Well on InAs Using AlInSb Buffer Layer Assisted by Interfacial Misfit Dislocation Arrays, <i>Fatih Furkan Ince, A. Newell, T. Rotter, G. Balakrishnan</i> , University of New Mexico; <i>M. McCartney, D. Smith</i> , Arizona State University	
9:45am	NM-TuM1-9 Molecular Beam Epitaxy of Kagome Antiferromagnetic Mn ₃ GaN grown on MgO(001), <i>Ali Abbas, A. Shrestha, A. Smith</i> , Ohio University	
10:00am	BREAK & EXHIBITS	
10:15am		
10:30am	NM-Tu2-12 Doping the Undopable: Hybrid Molecular Beam Epitaxy Growth, n-type Doping, and Field-Effect Transistor using CaSnO ₃ , <i>Fengdeng Liu</i> , University of Minnesota, USA; <i>P. Golani</i> , University of Minnesota; <i>T. Truttman</i> , University of Minnesota, USA; <i>I. Evangelista</i> , University of Delaware; <i>M. Smeaton</i> , Cornell University; <i>D. Bugallo</i> , Drexel University; <i>J. Wen</i> , University of Minnesota; <i>A. Kamath Manjeshwar</i> , University of Minnesota, USA; <i>S. May</i> , Drexel University; <i>L. Kourkoutis</i> , Cornell University; <i>A. Janotti</i> , University of Delaware; <i>S. Koester</i> , University of Minnesota; <i>B. Jalan</i> , University of Minnesota, USA	
10:45am	NM-TuM2-13 Controlling the Balance between Remote, Pinhole, and van der Waals Epitaxy of Heusler Films on Graphene/Sapphire, <i>Taehwan Jung, Z. LaDuca, D. Du, S. Manzo, K. Su, X. Zheng, V. Saraswat</i> , University of Wisconsin - Madison; <i>J. McChesney</i> , Argonne National Lab; <i>M. Arnold, J. Kawasaki</i> , University of Wisconsin - Madison	
11:00am	NM-TuM2-14 Synthesis of Flexomagnetic GdAuGe Membranes via Van Der Waals Epitaxy on Graphene Terminated Germanium, <i>Zachary LaDuca, S. Manzo, T. Jung, T. Samanta, K. Su, M. Arnold, J. Kawasaki</i> , University of Wisconsin - Madison	
11:15am	NM-TuM2-15 Flexomagnetism and Strain Induced Superconductivity in Rippled GdAuGe Heusler Membranes, <i>Tamalika Samanta, Z. LaDuca, D. Du, T. Jung, S. Manzo, K. Su, M. Arnold, J. Kawasaki</i> , University of Wisconsin - Madison	
11:30am	NM-TuM2-16 Growth Mechanism of SrTiO ₃ on a Graphene-covered Substrate Using Hybrid MBE, <i>SooHo Choo</i> , University of Minnesota, Republic of Korea; <i>H. Yoon</i> , University of Minnesota, USA, Republic of Korea; <i>B. Matthews</i> , Pacific Northwest National Laboratory; <i>S. Sharma</i> , University of Minnesota, USA; <i>S. Spurgeon, S. Chambers</i> , Pacific Northwest National Laboratory; <i>R. James, B. Jalan</i> , University of Minnesota, USA	
11:45am	NM-TuM2-17 Synthesis of Free-Standing Membranes Using a Sacrificial Layer Method Grown by Hybrid MBE, <i>Shivsheesh Varshney, S. Choo, Z. Yang, J. Wen, S. Koester, B. Jalan</i> , University of Minnesota, USA	

Tuesday Afternoon, September 19, 2023

Room Ballroom A		
1:30pm	GD-TuA1-1 InSb-Based Dilute-Bismide Alloys Towards Long-Wave Infrared Sensing, Corey White , <i>M. Bergthold, T. Leonard, A. Ricks, D. Wasserman, S. Bank</i> , The University of Texas at Austin	MBE-Grown Devices Session GD-TuA1 Solar Cell and Quantum Computing Moderator: Minjoo Larry Lee , University of Illinois Urbana-Champaign
1:45pm	GD-TuA1-2 Abrupt Te Doping of MBE-Grown GaInP for Solar Cell Applications, Brian Li , <i>Y. Sun, R. Hool, M. Lee</i> , University of Illinois, Urbana-Champaign	
2:00pm	GD-TuA1-3 MBE Growth of Metamorphic 1 eV InGaAs Solar Cells with Low Threading Dislocation Density, Adrian Birge , <i>M. Kim, B. Kim, D. Montealegre, M. Lee</i> , University of Illinois at Urbana-Champaign, USA	
2:15pm	GD-TuA1-4 Strained Superlattice InAlGaAs/AlGaAs Spin-Polarized Photocathodes Implemented with Random and Digital Alloying, Aaron Engel , University of California, Santa Barbara; <i>M. Stutzman</i> , Thomas Jefferson National Accelerator Facility; <i>J. Dong</i> , University of California, Santa Barbara; <i>C. Palmstrøm</i> , University of California, Santa Barbara	
2:30pm	GD-TuA1-5 Molecular Beam Epitaxy Growth and Characterization of InAs Quantum Wells Grown on Metamorphic III-V Buffer Layers, <i>I. Levy</i> , Patrick Stroheben , <i>W. Strickland, M. Hatefipour, J. Issokson, L. Baker</i> , New York University; <i>M. Mikalsen</i> , New York University; <i>S. Farzaneh, J. Shabani</i> , New York University	
2:45pm	GD-TuA1-6 Cryogenic Growth of Superconducting Thin Films on GaAs, Si, and Sapphire Substrates, Teun van Schijndel , <i>A. Engel</i> , University of California Santa Barbara; <i>J. Dong</i> , University of California at Santa Barbara; <i>A. McFadden</i> , NIST-Boulder; <i>C. Palmstrøm</i> , University of California Santa Barbara	
3:00pm	BREAK & EXHIBITS	
3:15pm		
3:30pm	NM-TuA2-9 TaO ₂ - The New Kid on the 5d Block, Yorick Birkhölzer , <i>A. Park, M. Barone, D. Schlom</i> , Cornell University	Novel Materials Session NM-TuA2 Novel Oxides and Superconductors Moderator: Matthew J. Brahlek , Oak Ridge National Laboratory
3:45pm	NM-TuA2-10 Growth of KTaO ₃ , KNbO ₃ and KNb _x Ta _{1-x} O ₃ solid solutions by Suboxide Molecular-Beam Epitaxy, Tobias Schwaigert , Cornell University; <i>S. Hazra</i> , Penn State University; <i>S. Salmani-Razaie</i> , Cornell University; <i>T. Kuznetsova</i> , Penn State University; <i>S. Ganschow</i> , Leibniz-Institut für Kristallzüchtung, Germany; <i>H. Paik</i> , Oklahoma State University; <i>D. Muller</i> , Cornell University; <i>R. Engel-Herbet</i> , Paul Drude Institute, Germany; <i>V. Gopalan</i> , Penn State University; <i>D. Schlom</i> , Cornell University; <i>K. Ahadi</i> , North Carolina State University	
4:00pm	NM-TuA2-11 Studying Electronic Structures of Pure SrCoO _x Thin Films, Ordered Phases, and Heterostructures, Jibril Ahammad , <i>G. Rimal</i> , Auburn University; <i>J. Sadowski</i> , Brookhaven National Laboratory; <i>G. Sterbinsky</i> , Argonne National Laboratory; <i>M. Boebinger</i> , Oak Ridge National Laboratory; <i>R. Comes</i> , Auburn University	
4:15pm	NM-TuA2-12 Synthesizing Metastable Ruddlesden-Popper Titanates by MBE in Pursuit of Next-Generation Millimeter-Wave Tunable Dielectrics, Matthew Barone , Cornell University; <i>Z. Tian</i> , University of California at Berkeley; <i>M. Papac</i> , National Institute of Standards and Technology, Boulder; <i>B. Goodge, E. Fleck, G. Olsen</i> , Cornell University; <i>K. Lee</i> , Hongik University, Republic of Korea; <i>L. Kourkoutis</i> , Cornell University; <i>N. Orloff</i> , National Institute of Standards and Technology, Boulder; <i>L. Martin</i> , University of California at Berkeley; <i>D. Schlom</i> , Cornell University	
4:30pm	NM-TuA2-13 MBE Synthesis and UV Raman Characterization of hexagonal ScFeO ₃ films, Nicholas Parker , <i>D. Schlom</i> , Cornell University; <i>D. Tenne</i> , Boise State University; <i>M. Barone</i> , Cornell University	
4:45pm	NM-TuA2-14 Growth and Characterization of Complex Nickelates with High Sr Concentration, <i>B. Paudel, L. Wang, Z. Yang, M. Bowden</i> , Pacific Northwest National Laboratory; <i>J. Liu</i> , Shanghai Institute of Microsystem and Information technology, China; <i>K. Koirala, T. Kaspar, P. Sushko, S. Chambers, Yingge Du</i> , Pacific Northwest National Laboratory	
5:00pm	NM-TuA2-15 Sharpening the Superconducting Transition of Bi ₂ Sr ₂ Ca _{n-1} Cu _n O _{2n+4} Films with n=1–3 Grown by MBE, Y. Eren Suyolcu , <i>Y. Li, D. Schlom</i> , Cornell University	
5:15pm	NM-TuA2-16 High-Temperature Superconductor FeSe Films Enabled Through Temperature and Flux Ratio Control, Maria Hilse , <i>H. Yi, C. Chang, N. Samarth</i> , The Pennsylvania State University; <i>R. Engel-Herbert</i> , Paul-Drude-Institut für Festkörperelektronik, Germany	

Wednesday Morning, September 20, 2023

Room Ballroom A		
8:00am	ST-WeM1-2 Thermal Laser Epitaxy - the Universal Epitaxy Tool(?), <i>Wolfgang Braun, D. Kim, F. Hensling, T. Smart, L. Majer, B. Faeth, S. Smink, D. Dereh</i> , Max Planck Institute for Solid State Research, Germany; <i>H. Boschker</i> , Epiray GmbH, Germany; <i>J. Mannhart</i> , Max Planck Institut for Solid State Research, Germany	Science and Technology of MBE Session ST-WeM1 Advancement in MBE Growth Approaches Moderator: Darrell Schlom, Cornell University
8:15am	ST-WeM1-3 Routes Towards Making BaZrSe ₃ Thin Films in the Perovskite Structure by MBE, <i>Ida Sadeghi, K. Ye, J. Van Sambeek, R. Jaramillo</i> , MIT	
8:30am	ST-WeM1-4 Adsorption Controlled Homoepitaxial Growth of c-Plane Sapphire by Thermal Laser Epitaxy, <i>Felix Hensling, L. Majer, S. Smink, J. Mannhart, W. Braun</i> , Max Planck Institute for Solid State Research, Germany	
8:45am	ST-WeM1-5 Prediction of MBE-grown Oxide Film Composition Using Neural Networks and Big Data Analytics, <i>Patrick Gemperline, R. Paudel, S. Thapa, S. Provence, S. Battles, R. Markland</i> , Auburn University; <i>R. Vasudevan</i> , Oak Ridge National Laboratory; <i>R. Comes</i> , Auburn University	
9:00am	ST-WeM1-6 Autonomous Synthesis in the MBE Using Real-Time Artificial Intelligence, <i>Tiffany Kaspar, L. Wang, J. Christudasjustus, M. Sassi, B. Helfrecht, J. Pape, A. Harilal, S. Akers, S. Spurgeon</i> , Pacific Northwest National Laboratory	
9:15am	ST-WeM1-7 The Role of Optical Excitation on Misfit Dislocations in Epitaxial ZnS on GaP, <i>Alexandra Fonseca Montenegro, M. Baan, A. Blackston, R. Myers, T. Grassman</i> , The Ohio State University	
9:30am	BREAK	
9:45am		
10:00am	ST-WeM2-10 Doping and Surfactant Behavior of Antimony and Gallium in Molecular Beam Epitaxy Grown Germanium-Tin, <i>Amanda Lemire, K. Grossklaus, C. Jamison, V. Vazquez, P. Hennessey, T. Vandervelde</i> , Tufts University	Science and Technology of MBE Session ST-WeM2 Fundamentals of MBE Growth Moderator: Stephanie Law, University of Delaware
10:15am	ST-WeM2-11 SiO ₂ Surface Planarization for Selective Area Regrowth of High Aspect Ratio Microstructures, <i>Ashlee Garcia, A. Skipper, M. Berghold, S. Bank</i> , University of Texas at Austin	
10:30am	ST-WeM2-12 InP Lateral Epitaxial Overgrowth by Solid-Source Molecular Beam Epitaxy, <i>Yiteng Wang, R. Hool, W. North, S. Pandey, E. Raftery, K. Choquette, M. Lee</i> , University of Illinois at Urbana-Champaign	
10:45am	ST-WeM2-13 Effect of Molecular Beam Epitaxy (Mbe) Growth Conditions on the Structural and Magnetic Properties of High Curie Temperature (MnSb ₂ Te ₄) _x (Sb ₂ Te ₃) _{1-x} Magnetic Topological Insulators, <i>Candice Forrester</i> , The City college of New York, Lehman College; <i>C. Testelin</i> , Institute des NanoSciences de Paris, France; <i>K. Wickramasinghe</i> , The City College of New York; <i>I. Levy</i> , New York University; <i>X. Ding, L. Krusin-Elbaum</i> , The City College of New York; <i>G. Lopez</i> , Lehman College; <i>M. Tamargo</i> , The City College of New York	
11:00am	ST-WeM2-14 Evolution of Antiferromagnetic Spin Texture in MBE-Grown Epitaxial Multiferroic BiFeO ₃ , <i>Maya Ramesh</i> , 105 Worth Street; <i>P. Meisenheimer</i> , University of California, Berkeley; <i>S. Zhou</i> , Brown University; <i>P. Stevenson</i> , Northeastern University; <i>L. Caretta</i> , Brown University; <i>R. Ramesh</i> , Rice University; <i>D. Schlom</i> , Cornell University	
11:15am	ST-WeM2-15 Adsorption-Controlled Growth of SrTiO ₃ by Oxide MBE, <i>Dylan Sotir, M. Barone, D. Schlom</i> , Cornell University	
11:30am	ST-WeM2-16 MBE of Ba ₂ BiTaO ₆ , a Candidate p-type Oxide Semiconductor, <i>Anna Park, Y. Birkhölzer, M. Barone, D. Schlom</i> , Cornell University	

Wednesday Afternoon, September 20, 2023

Novel Materials Room Ballroom A - Session NM-WeA Low Dimensional and Topological Materials Moderator: Joshua Zide, University of Delaware		
12:15pm	NM-WeA-1 Piezo- and Flexoelectricity Arising from Extreme Strain Gradients in Bent GaAs Nanowires, <i>F. Marin, O. Brandt, Lutz Geelhaar</i> , Paul-Drude-Institut für Festkörperelektronik Leibniz-Institut im Forschungsverbund Berlin, Germany	
12:30pm	NM-WeA-2 InAs Quantum Dot Nucleation on Finite Surface for Scalable Quantum Light Sources, <i>Chen Shang, Y. Pang, M. Kennedy</i> , University of California Santa Barbara; <i>G. Moody, J. Bowers</i> , University of California at Santa Barbara	
12:45pm	NM-WeA-3 Epitaxial Cd ₃ As ₂ Heterostructures for Vertical Device Architectures, <i>Anthony Rice, J. Nelson, A. Norman, K. Alberi</i> , National Renewable Energy Laboratory	
1:00pm	Closing Remarks and Thank You

Advanced Heterogeneous Integration Enabled by Remote Epitaxy

Jeehwan Kim

Associate Professor of Mechanical Engineering

Associate Professor of Materials Science and Engineering

For future of electronics such as bioelectronics, 3D integrated electronics, and bendable electronics, needs for flexibility and stackability of electronic products have substantially grown up. However, conventional wafer-based single-crystalline semiconductors cannot catch up with such trends because they are bound to the thick rigid wafers such that they are neither flexible nor stackable. Although polymer-based organic electronic materials are more compatible as they are mechanically compliant and less costly than inorganic counterparts, their electronic/photonic performance is substantially inferior to that of single-crystalline inorganic materials. For the past half a decade, my research group at MIT has focused on mitigating such performance-mechanical compliance dilemma by developing methods to obtain cheap, flexible, stackable, single-crystalline inorganic systems. In today's talk, I will discuss about our strategies to realize such a dream electronic system and how these strategies unlock new ways of manufacturing advanced electronic systems. I will highlight our remote epitaxy technique that can produce single-crystalline freestanding membranes including III-nitrides, III-V and complex oxide system with their excellent semiconducting performance. In addition, I will present unprecedented artificial heterostructures enabled by stacking of those freestanding 3D material membranes, e.g., world's smallest vertically-stacked full color micro-LEDs, world's best multiferroic devices, battery-less wireless e-skin, and heat dissipating system GaN power devices.

Biography

Prof. Jeehwan Kim is a tenured faculty at MIT. His research group's focuses on material innovations for next generation computing and electronics. Prof. Kim joined MIT in September 2015. Before joining MIT, he was a Research Staff Member at IBM T.J. Watson Research Center in Yorktown Heights, NY since 2008 right after his Ph.D. He worked on next generation CMOS and energy materials/devices at IBM. Prof. Kim is a recipient of 20 IBM high value invention achievement awards. In 2012, he was appointed a "Master Inventor" of IBM in recognition of his active intellectual property generation and commercialization of his research. After joining MIT, he continuously worked nanotechnology for advanced electronics/photonics. As its recognition, he received LAM Research foundation Award, IBM Faculty Award, DARPA Young Faculty Award, and DARPA Director's Fellowship. He is an inventor of > 200 issued/pending US patents and an author of > 50 articles in peer-reviewed journals. He currently serves as Associate Editor of *Science Advances*, AAAS. He received his B.S. from Hongik University, his M.S. from Seoul National University, and his Ph.D. from UCLA, all of them in Materials Science.

Flexomagnetism And Strain-Induced Superconductivity in Rippled GdAuGe Heusler Membranes

Tamalika Samanta, Zachary LaDuca, Dongxue Du, Taehwan Jung, Sebastian Manzo, Katherine Su, Michael Arnold, and Jason Kawasaki

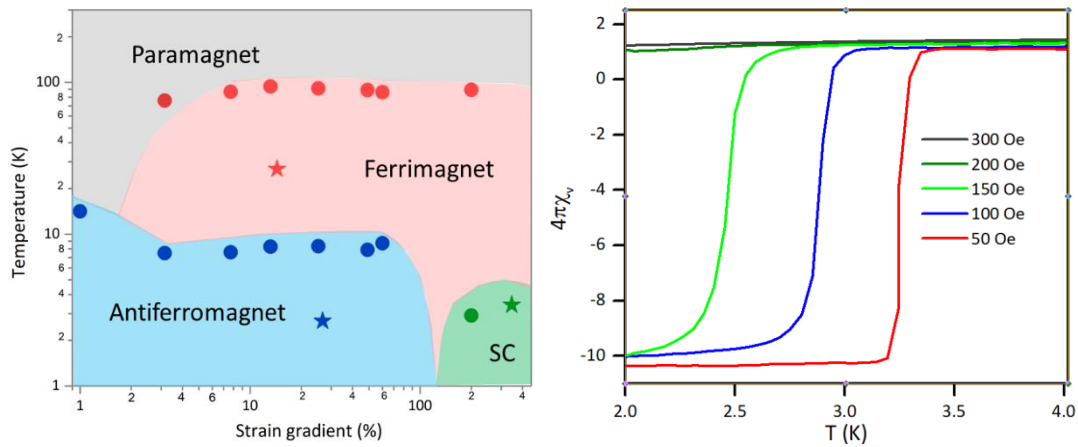

Figure 1: (a) Phase diagram for rippled GdAuGe membranes. The circle and star denote differently exfoliated rippled membranes. (b) The field-dependent onset of diamagnetism in a rippled membrane shows the Meissner response, implying superconductivity.

Supplementary Material

Figure 1. SEM image of a 60-nm-thick YbRh_2Si_2 film on a $\text{Ge}(001)$ substrate.

Figure 2. AFM image of the $5 \times 5 \mu\text{m}^2$ surface morphology of a 10-nm-thick YbRh_2Si_2 film on Ge after a sub-monolayer Yb soak, RMS = 1.8 nm

Figure 3 XRD scan of $\text{Ce}_3\text{Bi}_4\text{Pd}_3$ on sapphire. The RMS roughness of the sample, measured by AFM, is 2.8 nm

Figure 1 Control of doping in α -Sn films via surface termination of the InSb(001) substrate. a) ARPES measurement of 13 BL α -Sn grown in the In-rich $c(8 \times 2)$ reconstruction. b) ARPES measurement of 13 BL α -Sn grown in the Sb-rich $c(4 \times 4)$ reconstruction. A photon energy of 21 eV is chosen to accentuate the surface states. A clear shift in chemical potential from below the Dirac node to at the Dirac node is evident from a) to b). c) shows R_{xx} and d) shows R_{xy} measurements of 56 BL α -Sn grown on the same InSb surface terminations. Conductive InSb substrates make quantification difficult, but a clear change in carrier type is evident, showing the change in doping in a), b) is carried through to the bulk α -Sn.

Figure 3 Growth of α -SnGe thin films. a) RHEED oscillations showing preservation of layer by layer growth mechanism when the Sn films are alloyed with Ge. b) RHEED pattern of $(2 \times 1)/(1 \times 2)$ in 50 BL α -Sn. c) The same as b) in 50 BL α -SnGe. d) High resolution XRD reciprocal space map around the InSb(115) peak showing the α -SnGe is fully strained. Pendellosung fringes in the (001) direction are clear, indicative of high-quality interfaces.

Figure 2 Confirmation of 3D topological insulator-like phase. ARPES measurement at 21 eV before a) and after b) potassium dosing the surface. Potassium dosing effectively electron dopes the surface, allowing to see further above the surface Dirac node. The surface Dirac node is preserved without a gap opening. c) ARPES measurement at 127 eV after potassium dosing the surface. At this photon energy the bulk states at the bulk Γ point are observed. There is clear evidence of the valence band, but no conduction band evident below the Fermi level. This indicates at least a 200 meV bulk band gap. This film is thus 3D topological insulator-like.

Figure 4 Topological phase transition upon Ge alloying α -Sn films studied via ARPES measurements at 21 eV to accentuate the surface states. a) Pristine 13 BL Sn, b) Potassium dosing the film in a). c) 5% Ge alloying, resulting in about +0.5% strain. d) 8% Ge alloying, resulting in about +0.9% strain. A small gap opens at the surface Dirac node. A double peak is evident just above the gapped Dirac node. The exact cause is unclear, but is likely an additional, unpredicted surface state. e)-h) shows the curvature of a)-d), enhancing the contrast of the bands.

Improving MBE (Bi,Sb)₂(Te,Se)₃ Topological Materials Via Resonant and Magnetic Dopants

Figure 1: In-situ ARPES measurements from pure Bi₂Se₃ (left) and Bi₂Se₃ doped with resonant Sn (right) showing the behavior predicted by DFT calculations.

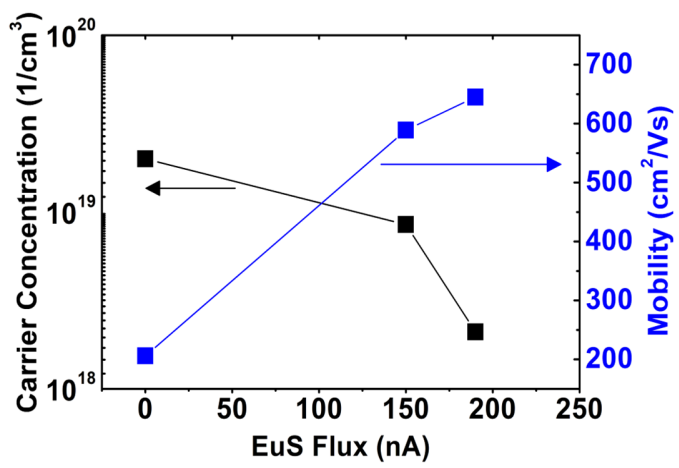

Figure 2: The improvement in transport properties of (Bi,Sb)₂(Te,Se)₃ doped with europium sulfide showing the desired reduction of bulk carriers (left), and near complete elimination of conduction band states with the Fermi level approaching the Dirac-like states.

Quasi Van der Waals Epitaxy of Magnetic Topological Insulators on a GaAs (111) Substrate

Yuxing Ren,¹ Lixuan Tai,² Kaicheng Pan,¹ Sidharth Srivastava,¹

Ya-Hong Xie,¹ Mark Goorsky,¹ Kang L. Wang^{1,2}

¹ *Materials Science and Engineering Department, University of California, Los Angeles, CA, USA*

² *School of Electrical and Computer Engineering, University of California, Los Angeles, CA, USA*

Magnetic topological insulator could achieve quantum anomalous Hall (QAH) effect and spin-orbit torque (SOT) switching in the same structure. This is promising for its future applications in memory or switching with its robust surface properties by topological protection. Considering the van der Waals nature of the epitaxial layers, it has very weak van der Waals bonding with the substrate. This gives rise to a novel quasi Van der Waals epitaxial growth mode at the interface of GaAs (111) substrates and the epitaxial layers, which has the advantages of both good crystallinity from substrate confinement, and a less influence from defects and roughness on the substrate surfaces. This is very crucial for achieving the quantization regime.

In this work we have done hetero-epitaxy of $\text{Cr}:(\text{Bi}_x\text{Sb}_{1-x})_2\text{Te}_3$ and other magnetic topological insulators on GaAs (111) substrates by MBE (Molecular Beam Epitaxy). Unlike the pure Van der Waals epitaxy which has more freedom at the interfaces epitaxial layer and substrates, we found out that in this quasi Van der Waals growth mode, strain exist and relaxes quickly within the 1st epitaxial layer. While the surface defects quickly get screened within the 1st layer, the surface confinement also gives the epitaxial layer a uniform in-plane orientation which is important for achieving a single crystalline structure. Growth mechanism and the influence on its transport properties are also discussed.

Abstract

Avalanche photodiodes (APDs) can be used in remote sensing applications, such as atmospheric greenhouse gas monitoring, free-space optical communications, and medical diagnostics, including the extended short-wavelength infrared (eSWIR) range between 1.3 μm and 2.5 μm . APDs have internal multiplication characteristics that allow them to detect weak signals. However, traditional *p-i-n* structure APDs, commonly used for longer infrared wavelengths (1.55 – 3.4 μm), can be performance-limited by the high dark currents due to band-to-band tunneling when subject to high electric fields. A separate absorption, charge, and multiplication (SACM) structure can be employed to improve their performance. The SACM structure decouples the absorption region from the multiplication regions, maintaining the absorber region below the tunneling threshold while keeping a high electric field only in the multiplier. In this work, we designed, grew, and fabricated an eSWIR SACM APD. The epitaxial layers grown by molecular beam epitaxy consist of a 5 nm-In_{0.53}Ga_{0.47}As/5 nm-GaAs_{0.51}Sb_{0.49}(InGaAs/GaAsSb) type-II superlattice (SL) absorber and 1000 nm-thick Al_{0.85}Ga_{0.15}AsSb (AlGaAsSb) multiplier on a InP substrate. The development of the SL involved the growth of InGaAs with a growth rate of 1 $\mu\text{m/hr}$ and a V/III beam equivalent pressure (BEP) ratio of ~ 10 , along with GaAsSb grown at a rate of 0.47 $\mu\text{m/hr}$ and a V/III BEP ratio of ~ 20 . Both were grown at a temperature of 470 $^{\circ}\text{C}$, as measured by the Bandit system. Meanwhile, AlGaAsSb was grown at a rate of 0.6 $\mu\text{m/hr}$ and a temperature of 500 $^{\circ}\text{C}$. The X-ray diffraction (XRD) result of our devices is presented in Figure 1, which reveals a mismatch of -440 arcsec and -260 arcsec for AlGaAsSb and SL, respectively. The period of the SL was calculated from a distance between the satellite peaks, determined to be 9.75 nm. These devices have a cut-off wavelength of 2.4 μm , a gain of up to 60 at room temperature, and a resulting quantum efficiency of 600% at 2 μm . as shown in Figure 3. Furthermore, the excess noise factor of our AlGaAsSb-based SACM APD stays below 2.2, up to a gain of 30. This value is considerably lower than competing technologies, with 2 times lower than InAlAs-based SACM APD and 1.2 times lower than InAlAsSb SACM APD on GaSb at the gain of 10.

These results demonstrate the potential of AlGaAsSb-based SACM APDs with InGaAs/GaAsSb SLs for various eSWIR detection applications and provide insight into the design and fabrication of SACM APDs with good noise and sensitivity characteristics, making them suitable for a range of remote sensing applications in the eSWIR range. These results have significant implications for developing highly sensitive and low-noise APDs for use in various applications.

Previously, interband cascade light-emitting diodes (ICLEDs) grown on GaSb substrates have been demonstrated as useful emitters in the mid-wave infrared (MWIR) region of 3 – 5 μm for room-temperature (RT) continuous wave (CW) operation [1,2]. Transferring this technology to growth on Silicon substrates would be advantageous for applications in chemical sensing and IR scene projectors (IRSPs), providing improved manufacturability through direct integration onto these circuits. This presentation will discuss the comparison of high-performance ICLEDs grown at NRL on GaSb/Si buffers that were grown at UNM and on lattice-matched GaSb substrates, including L-I characteristics, cross-section transmission electron microscopy (XTEM) and x-ray reciprocal space mapping (RSM).

The growth of GaSb/Si involves GaSb buffer layers which were grown on Silicon (001) with a 4° offcut towards (111). The native oxide was removed using a dilute HF solution to obtain a hydrogen-passivated surface. To achieve III-V nucleation on Silicon, a ~10 nm thick AlSb layer was grown at a substrate temperature of 500°C followed by a 1 μm buffer layer and an antimony cap to prevent oxidation. The GaSb/Si wafers were then transferred to NRL where an additional 2-3 μm GaSb buffer and the ungrouped active ICLED stages were grown. This same 22-stage structure was grown on a GaSb substrate as a control sample. Accounting for differences in architecture, the ICLED structures grown on Silicon show efficiencies that are 75% of those measured in ICLEDs grown on GaSb. At 100 mA, 200- μm -diameter mesas produce 184 μW CW at 25°C and 140 μW at 85°C.

Threading dislocations were observed in GaSb buffer grown on Si from the XTEM images, showing a higher density near the Silicon substrate but reduced near the ICLED. Individual dislocations which reached the active ICLED layers exhibited a multiplying effect throughout the structure. Another growth artifact seen in these images was a slow-varying oscillation in the ICLED layers. Our presentation will provide a detailed explanation for both mechanisms and a comparison of the ICLEDs grown on Silicon to those grown on GaSb. Possible strategies for improving the epitaxial quality and device performance will also be discussed.

*Email: tslay@dragon.nchu.edu.tw

We successfully demonstrate the parity-time symmetry (PT-symmetry) single-mode lasing operation of laterally coupled double-microdisk lasers. The microdisk lasers of disk diameter = 2.85 μm are fabricated by using MBE-grown InGaAs quantum dots as the gain medium. The gain materials of dots-in-a-well (DWELL) structures are grown on (001) n^+ -GaAs substrate by molecular beam epitaxy. The wafer structure consists of a 1 μm -thick $\text{Al}_{0.5}\text{Ga}_{0.5}\text{As}$ sacrifice layer, and an active layer comprised of a stack of six InGaAs DWELLS. In spite of the lasing output of multiple whispering-gallery modes (WGMs) from the single microdisk lasers, the laterally coupled double-microdisk lasers achieve single WGM lasing under gain-loss contrast pumping condition, literally pumping only one disk for the double- microdisk. We change the air gap distance (d) for the coupled double-microdisk structures to change the coupling strength (k) between the microdisks. Under single selective pumping (gain-loss contrast) at room temperature, the laterally coupled double microdisk lasers of $d = 150\text{nm}$, and 200nm show single lasing mode at WGM $m = 1, 21$ ($\lambda = 1199\text{nm}$). We also fabricate the double-microdisk lasers by coating the microdisks with HfO_2 to change the coupling strength k . Under single selective pumping, the HfO_2 -coated double microdisk lasers show a single lasing mode at WGM $m = 1, 20$ ($\lambda = 1277\text{nm}$).

Fig. 1. SEM picture for a single microdisk of diameter = 2.85 μm , and the lasing output of multiple WGMs .

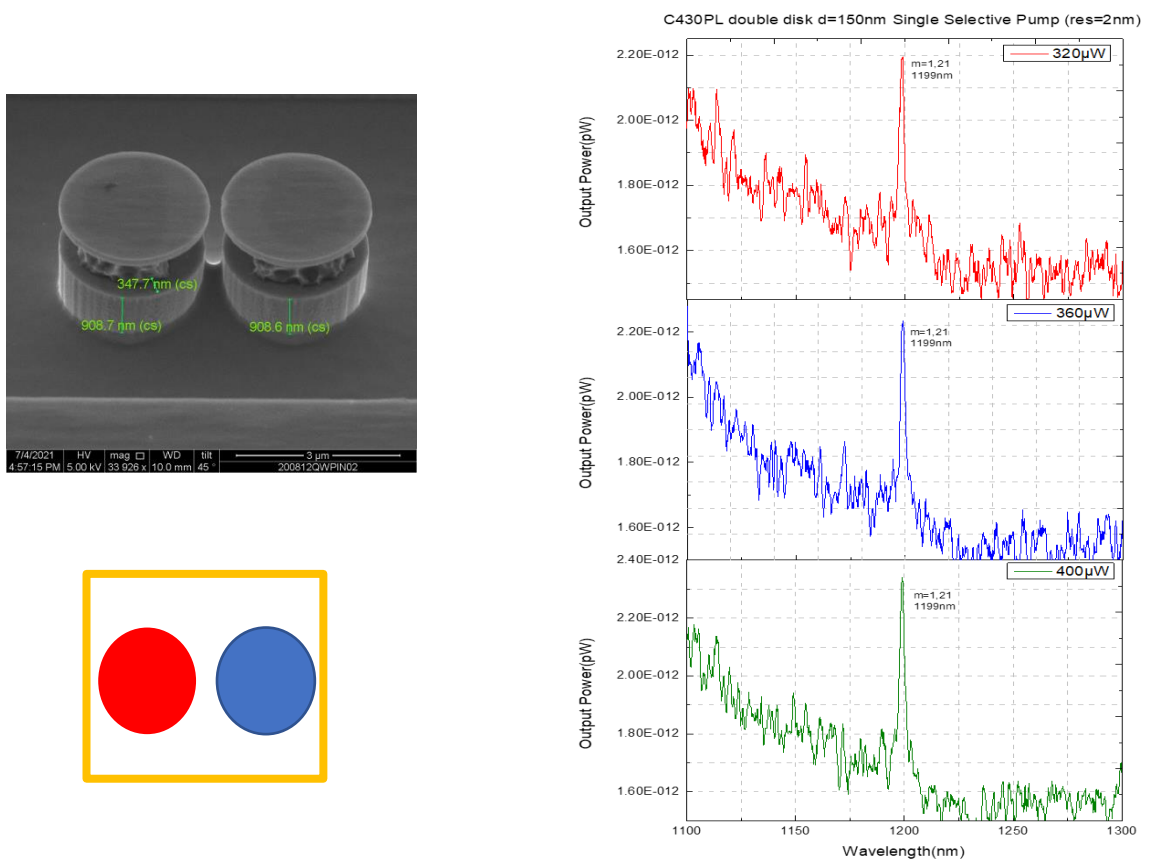

Fig. 2. Under single selective pumping (gain-loss contrast) at room temperature, single lasing mode at WGM $m = 1,21$ ($\lambda = 1199\text{nm}$) is obtained for the laterally coupled double- microdisk laser of $d = 150\text{nm}$.

Impact Ionization Coefficients of $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ ($x=0 - 1$) Lattice Matched to InP Substrates

Abstract

Impact ionization is a crucial process in the physics of semiconductors that influences the operation and performance of various semiconductor devices. It is utilized in avalanche photodiodes (APDs) to increase signal-to-noise ratio, but it can also lead to avalanche breakdown in electronic devices. To ensure reliable device operation, it is vital to determine the impact ionization coefficients of electrons and holes (α and β), respectively. In this study, we present the α and β for a range of $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ compositions, covering x from 0 to 1, as determined through measurements of avalanche multiplication. Additionally, we explore the relationship between the impact ionization coefficients and the bandgap (E_g) change (Γ and X points) along with the indirect-to-direct transition. This is because the impact ionization process is influenced by the material's band structure and the E_g .

Four PIN $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ APDs with x of 0, 0.5, 0.65 and 0.85 were grown on InP using the RIBER Compact 21DZ molecular beam epitaxy, and standard photolithography with a citric-based wet-etch technique was used to fabricate devices for electrical characterizations. The measured photocurrent spectra of the four APDs are presented in Fig. 1 (a), which illustrates that the cut-off tail moves toward lower energy as the x gradually decreases. To investigate the behavior of the E_g with various Al compositions, the $E_{g,\Gamma}$ and $E_{g,X}$ were extracted, as shown in Fig. 1 (b), and compared with the theoretical change in E_g proposed by Adachi [1]. The discrepancy of E_g between the theory and experiment may come from the alloy disorder that can induce lower E_g than expected in the theoretical calculation. The result suggests that the cross-over should happen around $x=0.5$ which is similar value predicted by Adachi [1].

The α and β for $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ with $x=0$, 0.85 [2], and 1 [3] were plotted as a function of inverse electric field as shown in Fig. 2 (a). Fig. 2 (b) illustrates the α and β for $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ with $x=0$, 0.85, and 1 as a function of x at 290 kV/cm. The α remains fairly constant until $x=0.85$, where it jumps up at $x=0$, while the β gradually increases as the x decreases from 1 to 0. This suggests that the α can change abruptly at a critical x point, and a similar point may exist for the rate of change in the β , as seen in other material systems such as AlGaInP and AlGaAs on GaAs [4]. To gain more insight, we will explore the behavior of E_g and α and β for additional $x=0$, 0.2, 0.4, 0.45, 0.50, 0.55, 0.65, 0.75, 0.85, and 1 in $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$. Knowing these coefficients and E_g parameters will allow engineers and scientists to design and optimize the performance of optoelectronic and electronic devices.

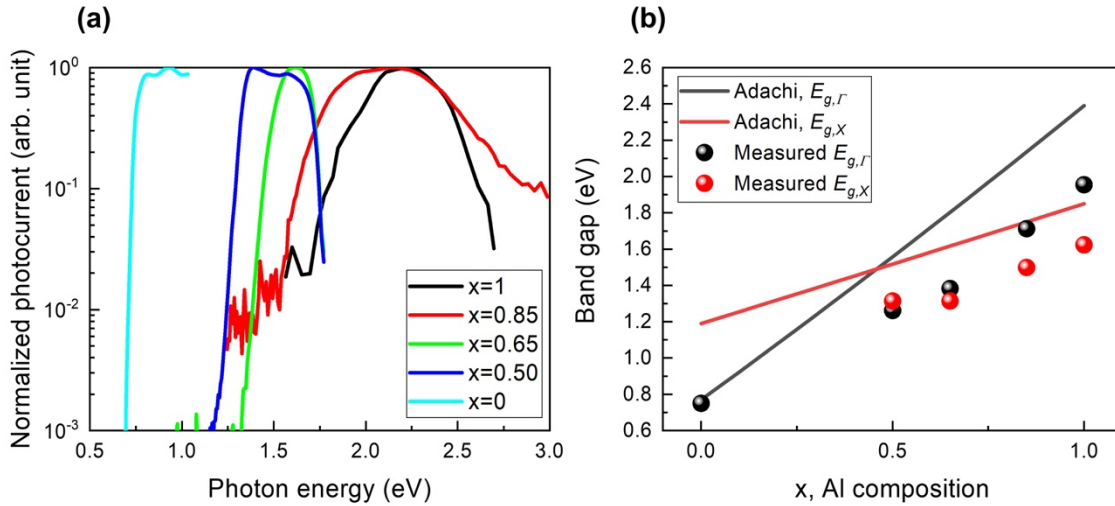

Figure 1 (a) The photocurrent spectra of $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ ($x=0, 0.5, 0.65, 0.85,$ and 1) and (b) their band gap change as a function of Al composition. The measured bandgaps were compared with the ones theoretically calculated by Adachi.

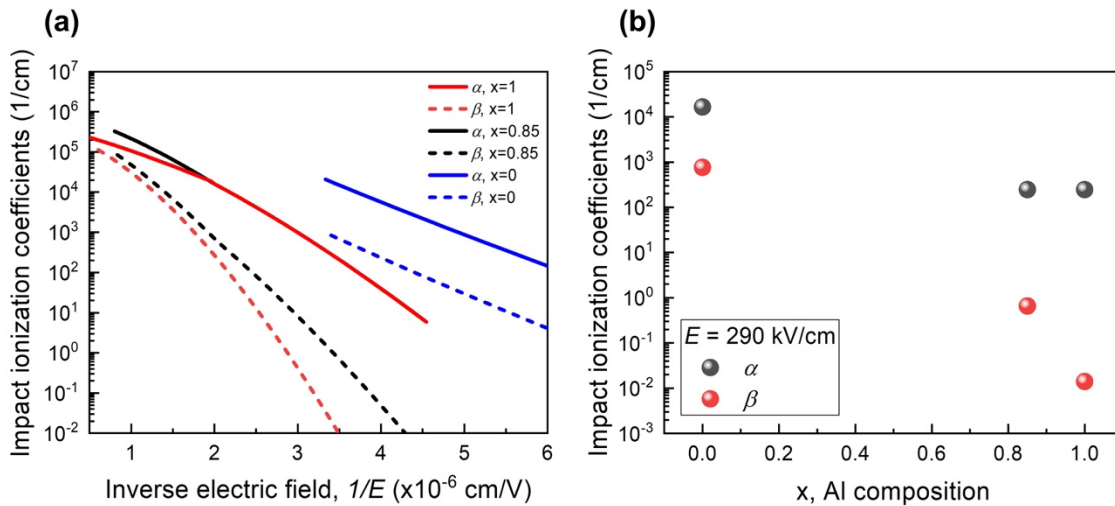

Figure 2 (a) Impact ionization coefficients (α and β) of $\text{Al}_x\text{Ga}_{1-x}\text{AsSb}$ ($x=0, 0.85,$ and 1) as a function of inverse electric field. (b) The α and β values extracted at 290 kV/cm as a function of Al composition.

Title: Zeeman Field-Induced Two-Dimensional Weyl Semimetal Phase in Cadmium Arsenide Thin Films

Abstract

We report a topological phase transition in MBE-grown, quantum-confined cadmium arsenide (Cd_3As_2) thin films under an in-plane Zeeman field when the Fermi level is tuned into the topological gap via an electric field. Symmetry considerations in this case predict the appearance of a two-dimensional Weyl semimetal (2D WSM), with a pair of Weyl nodes of opposite chirality at charge neutrality that are protected by space-time inversion (C_2T) symmetry. We show that the 2D WSM phase displays unique transport signatures, including saturated resistivities on the order of h/e^2 that persist over a range of in-plane magnetic fields. Moreover, applying a small out-of-plane magnetic field, while keeping the in-plane field within the stability range of the 2D WSM phase, gives rise to a well-developed odd integer quantum Hall effect, characteristic of degenerate, massive Weyl fermions. A minimal four-band $k\cdot p$ model of Cd_3As_2 , which incorporates first-principles effective g factors, qualitatively explains our findings.

Out-of-plane and in-plane magnetotransport. (a) Longitudinal conductivity σ_{xx} as a function of the out-of-plane field B_{oop} and the scaled (relative to V_{CNP}) top-gate voltage for the 18 nm Cd_3As_2 sample (device, hb1). Quantum Hall plateau regions are indexed by their filling factor ν up to 6. The measured voltage V_g is offset by V_{CNP} , which corresponds to the charge neutrality condition. (b) Longitudinal resistivity ρ_{xx} as a function of the in-plane field B_{ip} and the top-gate voltage for the 18 nm Cd_3As_2 sample (device, hb1). The same is shown in (c) for the 22 nm sample. $V_{\text{CNP}} = -1.35$ V for the 18 nm sample, $V_{\text{CNP}} = -1.165$ V for the 22 nm sample. Measurements were done at $T = 2$ K in the transverse configuration.

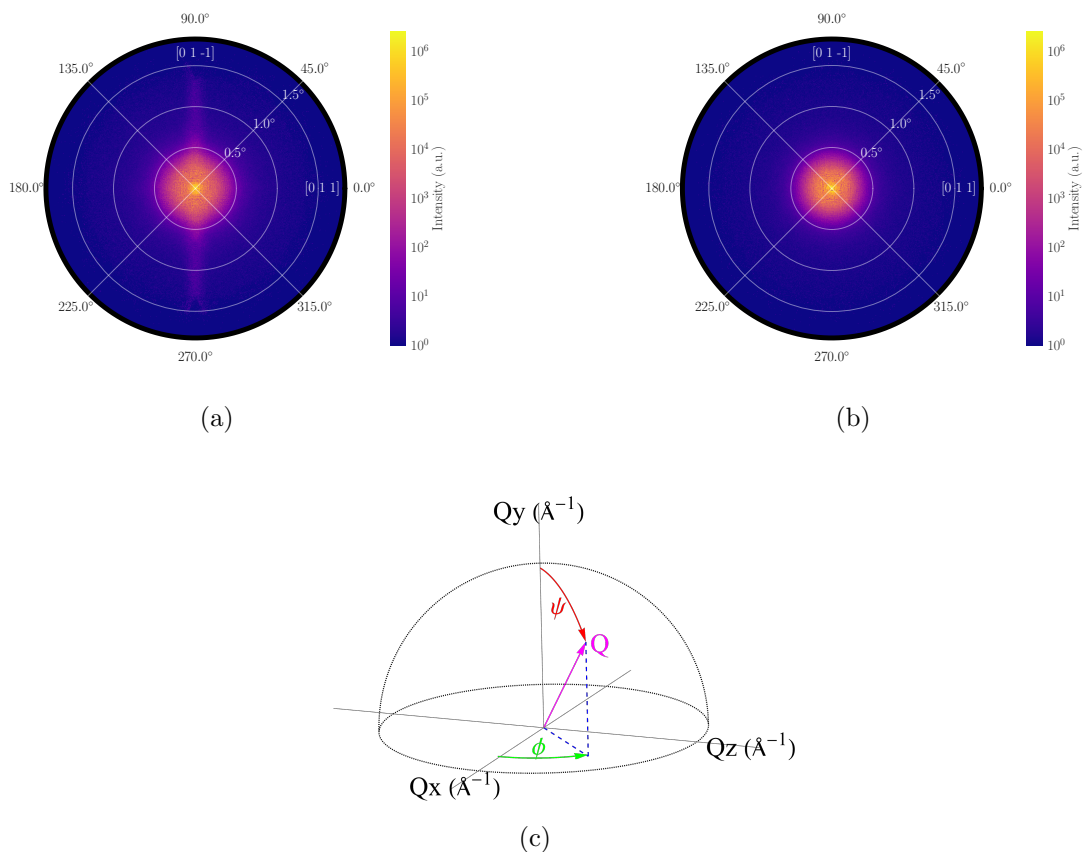

Figure 1: Two Polar plots of reciprocal space. The two coordinates of each point on the plot correspond to, an amount of tilt, ψ , away from the exact (001) planes and also an azimuthal angle, ϕ , that indicates the direction of the tilt. The relative intensities of points on the plot reveal what proportion of the crystal structure is tilted in that direction. Figure (a) corresponds to sample A and Figure (b) corresponds to sample B. The tilt ψ is measured as the radius and ϕ is the azimuthal angle measured counter-clockwise from the positive x axis. At $\phi = 0^\circ$ the incident X-ray beam is travelling in the [011] crystallographic direction. Figures (a) and (b) can be thought of as a 2D projection of the surface of the hemisphere shown in (c).

Figure 2: Scanning electron microscope ECCI images for (a) sample A and (b) sample B. Small dots of increased contrast caused by TDD are circled in red. The corresponding crystallographic directions and image scale are indicated by the blue arrows on the right.

1 RESULTS AND DISCUSSION:

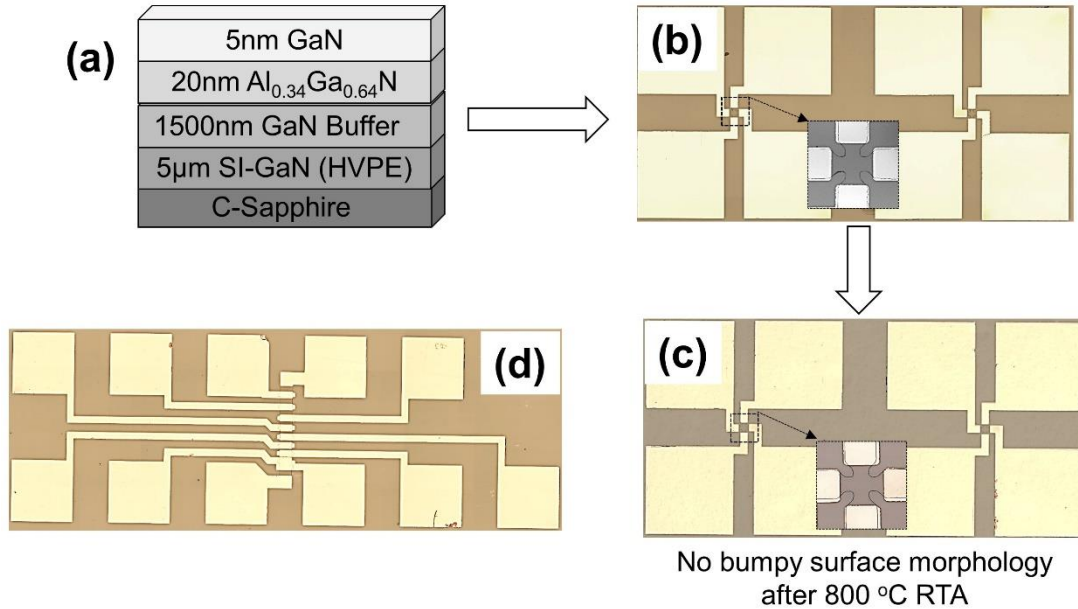

2 The $\text{Al}_{0.34}\text{Ga}_{0.66}\text{N}/\text{GaN}$ microfabricated Hall sensor [**Fig. 1(b)**], where evaluation of the 2-
 3 DEG is achieved by investigating the Hall voltage which has direct influence on drift velocity of
 4 carrier, as a function of thermal aging time. Fabricated Micro-Hall sensor sensitivity tested under
 5 constant current and voltage bias mode for all thermal annealing protocol, corresponding data
 6 presented in **Fig. 2(a & b)**. The efficiency of $\text{Al}_{0.34}\text{Ga}_{0.66}\text{N}/\text{GaN}$ micro-Hall sensor under thermal
 7 aging, we calculated the Absolute Sensitivity (S_A), of a Hall device is defined as the change in
 8 output Hall voltage (V_H) divided by the change in applied magnetic field (H) i.e., $S_A =$
 9 $G_H \frac{r_H}{qN_{2\text{deg}}} I_b - - (1)$. Similarly, Supply Current Related Sensitivity (S_{scrs}) expressed as $S_{\text{scrs}} =$
 10 $G_H \frac{r_H}{qN_{2\text{deg}}} - - (2)$, and Supply Voltage Related Sensitivity (S_{svrs}) can be defined as $S_{\text{svrs}} =$
 11 $G_H \frac{r_H}{RqN_{2\text{deg}}} - - (3)$ which implies that $S_{\text{svrs}} = \mu_H G_H \left(\frac{L}{W}\right) - - (4)$. From above relation, it is
 12 clear that current-related sensitivity (S_{scrs}) is inversely proportional to (n_s) and the voltage-related
 13 sensitivity (S_{svrs}) is directly proportional to electron mobility. The measured taken current-related
 14 sensitivity (S_{scrs}) were found to be $74 \text{ VA}^{-1}\text{T}^{-1}$ and $82 \text{ VA}^{-1}\text{T}^{-1}$ (SCRS), and voltage-related
 15 sensitivity (S_{svrs}) are measured to be 0.053 T^{-1} and 0.051 T^{-1} (SVRS) for pristine sample and
 16 after 2800 hours thermal aging at $200 \text{ }^\circ\text{C}$ in air. As we seen from **Fig. 2** there will be $\sim 2\%$
 17 improvement in SCRS and $\sim 2\%$ change in SVRS of the Hall sensor after a prolonged baking times
 18 of 2800 hours at $200 \text{ }^\circ\text{C}$. As expected, the Hall sensor has the ability to survive at $200 \text{ }^\circ\text{C}$ in air for
 19 an extended period of time. The slight increasing trend of SCRS and decreasing trend of SVRS
 20 with heating due to the combined changes in sheet carrier density and mobility ($n_s\mu$).

21 CONCLUSIONS:

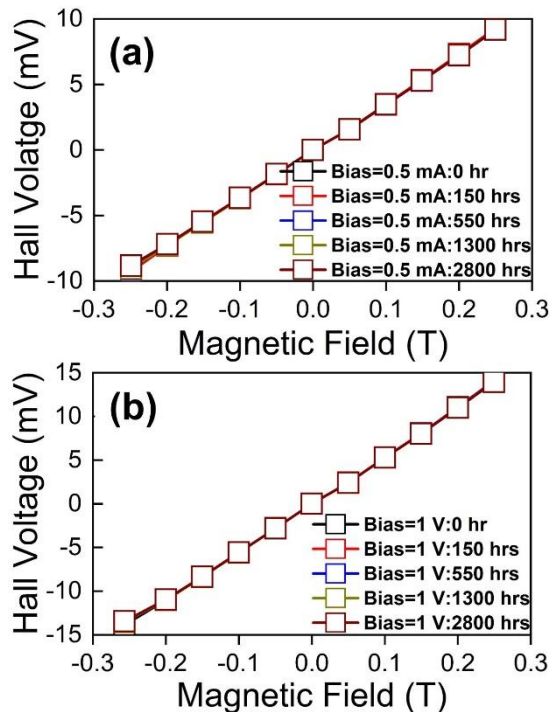

22 We have investigated the temperature response of $\text{Al}_{0.34}\text{Ga}_{0.67}\text{N}/\text{GaN}$ Hall sensors, in terms
 23 of the Hall sensitivity, and Ohmic contacts during thermal aging at $200 \text{ }^\circ\text{C}$ for up to 2800 hours
 24 under atmospheric conditions. The MBE grown $\text{Al}_{0.34}\text{Ga}_{0.67}\text{N}/\text{GaN}$ Hall sensors were
 25 characterized by using HR-XRD, micro-Raman, and XPS on Hall sensor device before and after
 26 thermal aging time. To compare the performance of the Hall sensor we have correlated the
 27 structural evolution in $\text{Al}_{0.34}\text{Ga}_{0.67}\text{N}/\text{GaN}$ Hall sensor heterostructures with measured electric
 28 response of Hall device. Results indicate that the $\text{Al}_{0.34}\text{Ga}_{0.67}\text{N}/\text{GaN}$ Hall sensor provides stable
 29 performance for as long as 2800 hours aging at $200 \text{ }^\circ\text{C}$ without any significant degradation to the
 30 sensitivity, and Ohmic contacts. However, this study conducted for Hall sensor device does not
 31 have surface passivation, though we have noticed the out-diffusion of ‘Ga’ and ‘Al’ does not affect
 32 much on performance of the Hall sensor. Addition we have found initial stage of contacts
 33 resistance droop which could be due to out ‘Ga’ or Al diffusion process may be consequence of a
 34 reduction of oxygen concentration at the GaN/Ti interface resulting in a reduced contacts barrier
 35 height. The ‘Pt’ based ohmic contact enables bumpy free surface morphology after 800°C RTA.

Supplemental document: Impact of unintentional Sb in the tensile electron well of type-II InAs/InAsSb superlattices grown on GaSb by molecular beam epitaxy

Marko S. Milosavljevic, Preston T. Webster, and Shane R. Johnson

The figure below shows the photoluminescence spectra from four 5.3 μm midwave and four 12.0 μm longwave InAs/InAsSb superlattices, measured at 80 K with an 808 nm pump power of 200 mW. The solid vertical lines indicate the superlattice bandgap energy extracted from each spectra. The dashed lines indicate the expected bandgap position for a structure with a pure tensile InAs layer. The blue shift in the measured bandgap indicates the presence of unintentional Sb in the tensile InAs layer.

In the figure below, left panel (a) shows measured Sb mole fractions in the compressive layer as open black circles and the tensile layer as open red circles for the mid and long wave structures. The fit to the model is shown as solid black and red curves for the tensile and compressive layers respectively. The mole fraction versus monolayer number is shown in panels (b) and (c) for the mid and long wave InAs/InAsSb superlattices; the Sb profile is in red and the average of the profile is in black.

The average structure of the grown midwave and longwave InAs/InAsSb superlattices is shown in the table below. The layer thicknesses and Sb mole fractions are averages and are labeled as the “Grown” structure. For comparison, an “Ideal” structure with no unintentional Sb in the tensile InAs layer is also shown. The 80 K bandgap, compressive Sb mole fraction, and tetragonal distortion are the same for both the grown and ideal structures. The grown structures have a significantly thicker tensile layer. a slightly thinner compressive layer, and a smaller electron-hole wavefunction overlap.

Superlattice type	Superlattice tetragonal distortion (%)	80 K Bandgap		Structure	Sb mole fraction (%)		Thickness (nm)		Electron-hole overlap squared (%)
		(meV)	(μm)		Tensile InAs(Sb)	Comp. InAsSb	Tensile InAs(Sb)	Comp. InAsSb	
Mid-wave	-0.0013	233	5.3	Grown	1.8	40.0	4.61	1.12	58.2
				Ideal	0	40.0	3.87	1.18	63.1
Long-wave	0.0269	103	12.0	Grown	1.2	40.5	9.56	2.56	22.2
				Ideal	0	40.5	8.54	2.62	24.8

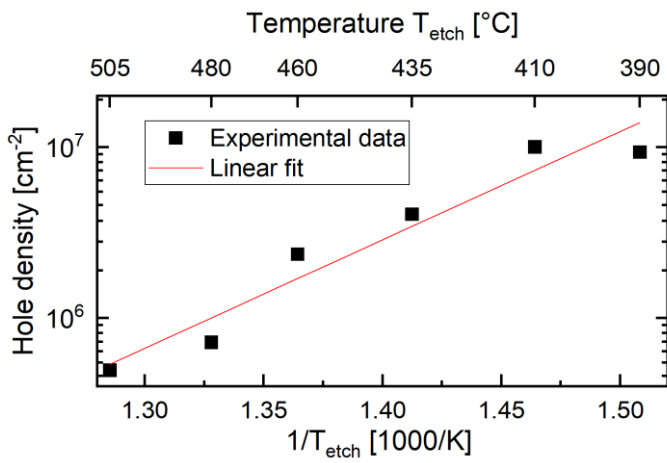

Fig. 1: Surface density of etched nanoholes vs. the inverse etching temperature T_{etch} . Data points were generated by counting nanoholes at 2,000x magnification in an SEM evaluating at least 40 nanoholes per temperature.

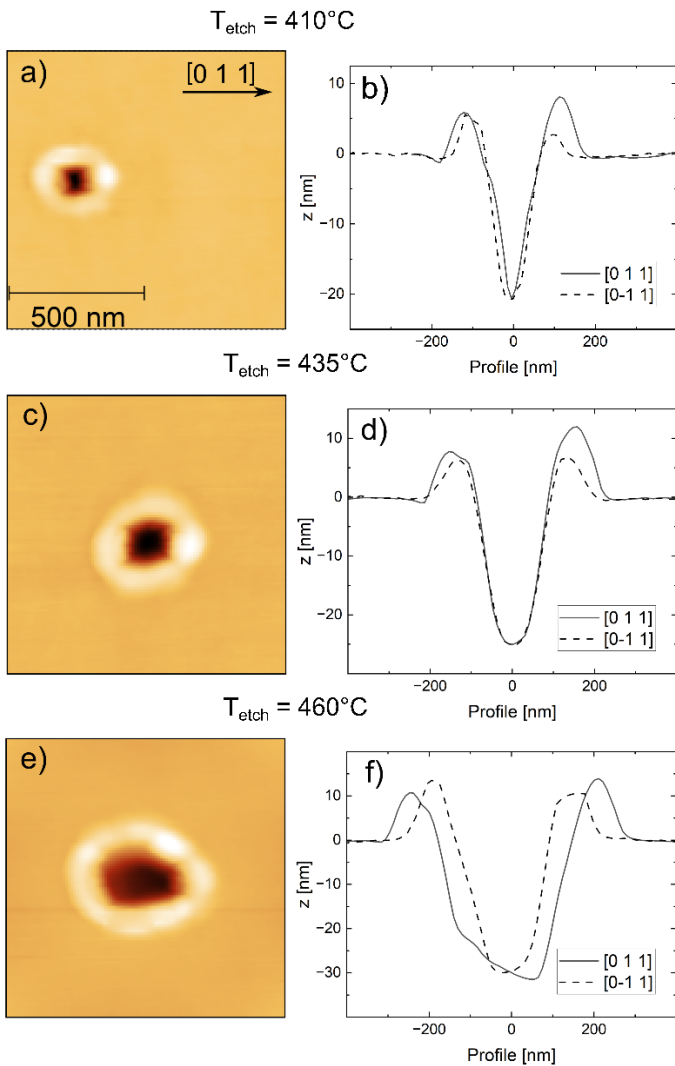

Fig. 2: AFM images and line profiles for samples overgrown with 50 nm $In_{0.52}Al_{0.48}As$ and etched at 410°C (a) and b)), at 435°C (c) and d)), and at 460°C (e) and f)), respectively. Etching was performed with 4.1 ML of $InAl$. The size of the AFM images is $1 \times 1 \mu m^2$.

Fig. 3: AFM images and profiles for nanoholes etched with approximately 2 ML of Al (a) and b)) and 2 ML of In (c) and d)). The etching temperature T_{etch} was in both cases 435°C. Holes etched with Al are significantly more elongated along the [011] direction as can be seen from the image a) and the line scans along the high symmetry directions b).

Fig. 4: Ensemble photoluminescence from quantum dots generated by $In_{0.53}Ga_{0.47}As$ filling of nanoholes etched at 435°C and 460°C and 50 nm $In_{0.52}Al_{0.48}As$ overgrowth (see Fig. 2 c) - f)). The filled holes have been capped by 100 nm $In_{0.52}Al_{0.48}As$. The $In_{0.53}Ga_{0.47}As$ deposition amount is given in the figure as an equivalent homogeneous layer deposition and corresponds to the maximum possible filling amount for nanoholes generated at these temperatures, which was found by investigating uncapped holes filled with the same parameters.

Strain-mediated Sn incorporation and segregation in compositionally graded $\text{Ge}_{1-x}\text{Sn}_x$ epilayers grown by MBE at different temperature

Nirosh M. Eldose,^{1,*} Hryhorii Stanchu,¹ Subhashis Das¹, Satish Shetty¹, Chen Li¹, Yuriy I. Mazur¹,
Shui-Qing Yu,² and Gregory J. Salamo¹

Group IV alloys of Ge and Sn are extensively studied for various electronic and optoelectronic applications on a Si platform. $\text{Ge}_{1-x}\text{Sn}_x$ with α -Sn concentrations as low as 6% [1] allows for a transition from an indirect bandgap to a direct optical. Higher Sn content makes possible mid and even long-range infrared optical emission and detection [2]. At the same time, due to the low solid solubility of Sn in Ge ($\sim 1\%$), as well as the large lattice mismatch of α -Sn with Ge ($\sim 14\%$), the realization of high-quality Sn-rich $\text{Ge}_{1-x}\text{Sn}_x$ structures has proved challenging. In this study, we demonstrate enhanced Sn content using molecular beam epitaxy (MBE) growth of compositionally graded $\text{Ge}_{1-x}\text{Sn}_x$ on Ge (001). High-quality GeSn alloys with Sn composition reaching 6% at constant temperature. The maximal fraction of Sn was further increased to 9.0% when the growth temperature was continuously lowered while increasing the Sn flux. The analysis of surface droplets and SIMS (secondary ion mass spectrometry) profiles of elemental composition give evidence of Sn rejection during the growth, potentially associated with a critical energy of elastic strain. The intentional reduction of the coherent strain by decreasing the Sn flux near the sample surface has shown to trap a higher fraction of Sn in the $\text{Ge}_{1-x}\text{Sn}_x$ layer and lower surface segregation. Supporting data (Fig.2) shows an approach for XRD spectra simulation was developed for strain and composition characterization.

Chen Li¹, Mourad Benamara¹, Yuriy I. Mazur¹, Gregory Salamo^{1,2}

¹ Institute for Nanoscience and Engineering, University of Arkansas, Fayetteville, AR, 72701, USA.

² Department of Physics, University of Arkansas, Fayetteville, AR, 72701, USA.

Epitaxial growth of III-V semiconductors on 4H-SiC would potentially allow the integration of optical sensors on SiC based power devices. We report on the growth of high-quality crystalline GaAs layer on the SiC hexagonal substrate by molecular beam epitaxy (MBE). For fabrication on SiC, a 5 nm AlAs nucleation layer was grown at 700 °C followed by a 60 nm GaAs layer buffer grown at 600 °C. We will discuss the surface morphology, structural quality, and the optical properties of the MBE grown samples. The ω - 2θ scan result (fig. 1. (a)) corroborates the crystalline growth of GaAs (111) on 4H-SiC. The structural quality is further illustrated by the cross-sectional TEM image in fig. 1(b). It consists of a high-quality GaAs layer and a highly defected interface region between GaAs and the 4H-SiC substrate. This defect region is attributed to the lattice and crystal structure mismatch between substrate and film. Fig. 1(c) shows the temperature dependent photoluminescence properties of the grown structure. Good free-exciton (FE) emission has been observed at room temperature (300 K) and lower temperature (77 K). Excitingly, the optical results were comparable with the same structure grown on a GaAs substrate. Overall, these observations exhibit potential to achieve an optical emitter for sensors integrated on SiC based power device platform.

Abstract

Van der Waals (vdW) heterostructures combining layered ferromagnets and other two-dimensional (2D) crystals such as graphene and transition metal dichalcogenides are promising building blocks for the realization of ultra-compact devices with integrated magnetic, electronic and optical functionalities. Their implementation in various technologies depends strongly on the development of a bottom-up, scalable synthesis approach allowing to realize highly uniform heterostructures with well-defined interfaces between different 2D layered materials. It also requires that each material component of the heterostructure remains functional, which ideally includes ferromagnetic order above room temperature for 2D ferromagnets. In this contribution, we will present our recent results on van der Waals (vdW) epitaxy of the 2D itinerant ferromagnetic metal $\text{Fe}_{5-x}\text{GeTe}_2$ (FGT, $x \sim 0$) on single crystalline epitaxial graphene using molecular beam epitaxy. For the growth of FGT films (with thickness ranging from 10 to 15 nm), elemental Fe, Ge, and Te were co-supplied from conventional effusion cells, and a growth temperature of 300 °C was employed. As a substrate, epitaxial graphene on 4H-SiC(0001), synthesized via SiC surface graphitization, was employed. Morphological and structural characterization using methods such as atomic force microscopy, synchrotron-based grazing incidence X-ray diffraction, and scanning transmission electron microscopy (STEM) revealed that epitaxial FGT films exhibiting very good surface morphology, high crystalline quality, and a sharp interface to graphene could be realized. Interestingly, stacking faults related to the presence of single FGT layers with thicknesses exceeding those expected for the Fe_5GeTe_2 phase could be identified by STEM. We expect these to be novel FGT metastable phases with Fe composition higher than 5 and potentially enhanced magnetic properties. Temperature-dependent magneto-transport measurements and superconducting quantum interference device (SQUID) magnetometry were employed to assess the magnetic properties of the samples. Ferromagnetic order with a predominant out-of-plane magnetization was shown to persist above 350 K. Furthermore, magneto-transport also revealed that the epitaxial graphene continues to exhibit a high electronic quality. These results represent an important advance beyond non-scalable flake exfoliation and stacking methods, thus marking a crucial step toward the implementation of ferromagnetic 2D materials in practical applications.

Materials Research Institute, Pennsylvania State University, PA 1680, USA

Two-dimensional transition metal dichalcogenides (TMDCs) are an interesting platform to interrogate fundamental physics questions as well as to advance the development of optoelectronic technologies. Both these endeavors are heavily dependent on having high-quality TMDCs, realized only after employing extensive growth optimization procedures. In this work, we investigated the growth and the optical properties of ZrTe₂, a candidate topological Dirac semimetal. During the growth of 12 unit cells (u.c.) of ZrTe₂ on a sapphire substrate, we obtained in-situ spectroscopic ellipsometry after the deposition of each u.c. After the deposition of the ZrTe₂, we deposited a Te capping layer to protect the TMDC film. X-ray reflectivity measurements performed subsequently indicated that the total thickness of ZrTe₂ and the thickness of Te to be 5.95 nm and 19 nm, respectively.

A standard inversion technique was used to model the ellipsometry spectra by specifying a three layer model (i.e., sapphire substrate, ZrTe₂ layer and the Te capping layer) to fit the final ellipsometry spectra. The thicknesses obtained from X-ray reflectivity allowed us to obtain the precise dielectric function of the final ZrTe₂ layer (i.e., 12 u.c.). Subsequently, we fit the remaining ellipsometry spectra obtained for 11 u.c. through 1 u.c. ZrTe₂ and obtain their dielectric functions. Clearly, the dielectric functions show a noticeable change with the thickness of the ZrTe₂ layers, where the absorption depicted by the imaginary part of the dielectric function increases with the thickness of ZrTe₂. Additionally, the layer-dependent dielectric functions were analyzed by incorporating a Drude oscillator to account for the free electrons and two Kramers-Kronig-consistent oscillators to represent the band-to-band transitions. Interestingly, we find that the Drude contribution reduces as the thickness of ZrTe₂ gets smaller, suggesting that its metallic character diminishes as the thickness reduces. Further analysis of the optical conductivity verifies this observation.

The work at Kenyon is funded by DMR-2004812 and the work at The Pennsylvania State University Two-Dimensional Crystal Consortium – Materials Innovation Platform (2DCC-MIP) is supported by NSF cooperative agreement DMR-1539916 and DMR-2039351.

Fig. 1. High-angle annular dark-field (HAADF) image with atomic number Z-contrast of the 7 nm thick Ga(As,Bi) QW with 20 nm thick (Al,Ga)As barriers. The expected HAADF bright contrast of the QW is due to the presence of Bi, $Z_{\text{Bi}} = 83$, in the layer.

Fig. 2. Chemically-sensitive g_{002} dark-field TEM micrograph of the Ga(As,Bi) QW with 20 nm thick (Al,Ga)As barriers. Note the presence of two lines with darker contrast delimiting the interface position, at the location of the growth interruptions (GI).

Fig. 3. High-resolution (HR) TEM micrograph of the Ga(As,Bi) QW. CuPt_B atomic ordering is detected inside the 7-nm-thick QW but not at two unintentional layers before and after the QW, at the GI positions.

Figure 1: Sapphire surface structure annealed at 750°C (1) and 1550°C (2). Growth of Bi₂Se₃ on sapphire annealed at 750°C (3) and 1550°C (4). The sample grown on sapphire annealed at 1550°C appears to have less vertical island growth with slightly larger, less distinctive, domains. This sample also clearly grows on the same terraced step structure as the base sapphire.

III-nitride semiconductor materials have proved to be ideal materials for high-power, high-frequency, and high-temperature applications because of their tunable direct band gaps, high breakdown voltage, high absorption coefficient, resistance to defects, lattice match, and polarization characteristics. These materials form a continuous alloy system with direct bandgaps from 6.2 eV (AlN) through 3.4 eV (GaN) to 0.7 eV (InN). The compositionally graded Group III-nitride alloy enables access to large range of energies through varying the bandgap. This change in bandgap is achieved through varying the indium and aluminum composition during growth, which yields excellent compatibility for various optoelectronic applications.

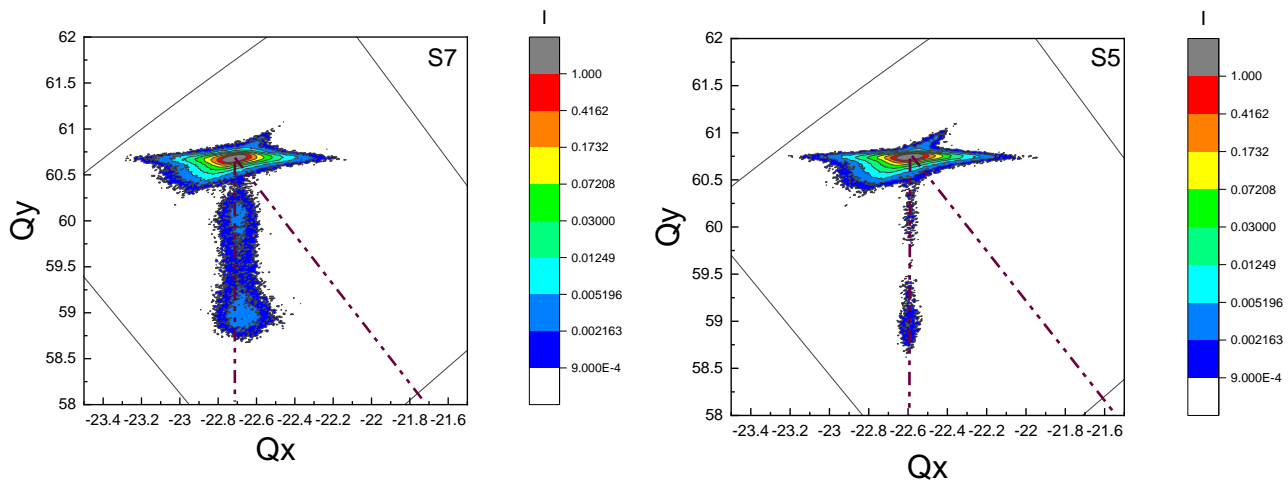

The growth and quality of mismatched heteroepitaxial III-Nitrides layers are generally influenced by strain relaxation mechanisms that release the accumulated strain energy. Plastic relaxation is generally started by the formation of misfit dislocations above the critical thickness. This has been well studied and is generally understood for heteroepitaxial films with fixed composition. Graded composition films have been investigated recently for potential incorporation into semiconductor devices, however the issue of plastic relaxation for graded III-Nitride semiconductors has not been thoroughly investigated.

Graded InGaN and AlGaN can be grown pseudomorphically strained to its substrate until some critical amount of strain energy is built up. This can happen either as a result of reaching a maximum composition or a maximum growth thickness. These two parameters are not independent in terms of their contribution to the buildup of strain energy, and the goal of this study is to determine both the range over which these alloy layers can be grown without relaxation and the mechanisms by which they exhibit relaxation.

In the present work, we have grown both graded InGaN and AlGaN layers with 30 % of In and Al composition of increasing thicknesses for 15 min, 30 min, and 60 min on GaN substrates. We investigated their properties through X-ray diffraction reciprocal space mapping (RSM). With increasing the thickness of these graded layers, the InGaN or AlGaN signature in the RSM shifts from a fully strained position. Atomic force microscopy will be also used to characterize the

sample surface of interest, including dislocation density, while transmission electron microscopy will be used to understand the nature of relaxing defects that is formed in these layers. How these introduced dislocations impact the electrical and optical properties will be demonstrated through photoluminescence and Raman spectroscopy.

- X-ray diffraction reciprocal space mapping (RSM)

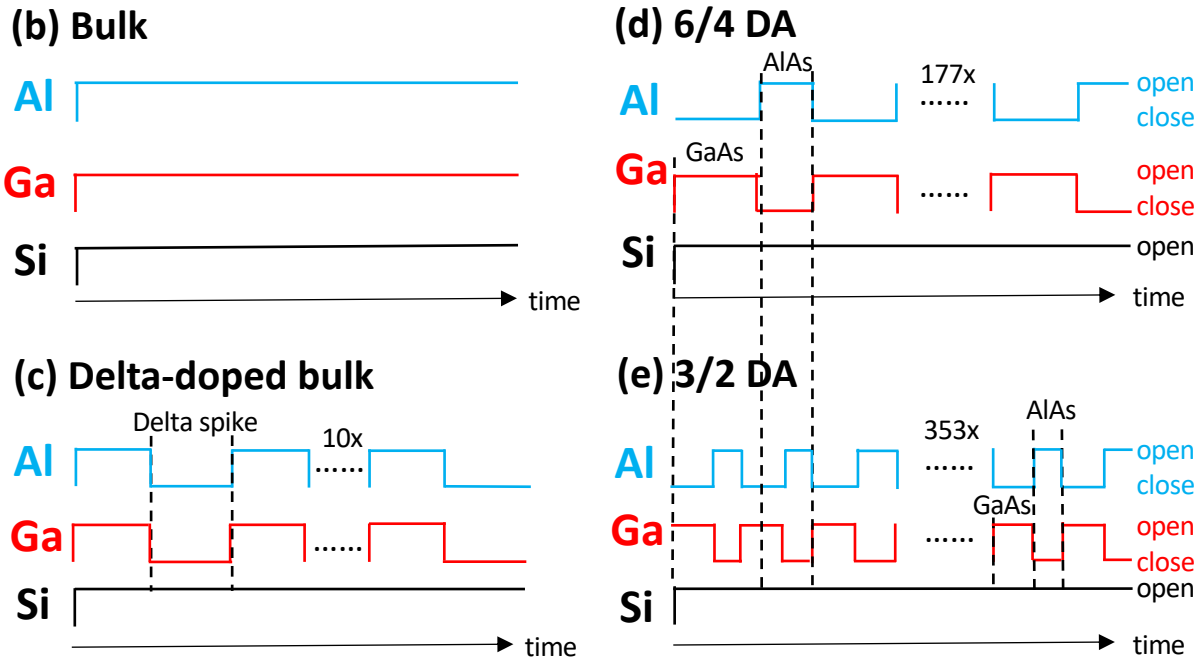

With increasing the thickness of these graded layers, the InGaN or AlGaIn signature in the RSM shifts from a fully strained position.

(d) Room temperature dielectric tunability of the same MIM heterostructure.

Fig. 1: State of the art triple-chamber TLE research systems. The smaller system in the back is designed for substrate sizes up to 2", the larger one in the front for substrate sizes up to 4". The 1 μm wavelength source heating lasers are coupled to the machine via the yellow fiber cables, 10 μm wavelength CO₂ beamline-guided lasers are used for substrate heating. The compact design ensures high pumping speeds and small footprints. The sources are transferred into and out of the growth chamber via a single transfer mechanism also used for sample transfer. They may be stored in the middle chamber for high purity and rapid exchange.

Fig. 2: Growth rates of TLE Al sources (12 mm diameter sapphire crucibles) at three different O₂ background pressures as a function of laser power for a fixed spot diameter on the source of about 0.7 mm FWHM. In the presence of 10⁻³ hPa O₂, the flux deviates from the approximately straight line measured in UHV at low powers, indicating the formation of a volatile suboxide at the source surface depending on the oxygen pressure (not shown) and the metallic area as defined by either a stationary (bottom) or circularly moving beam (top).

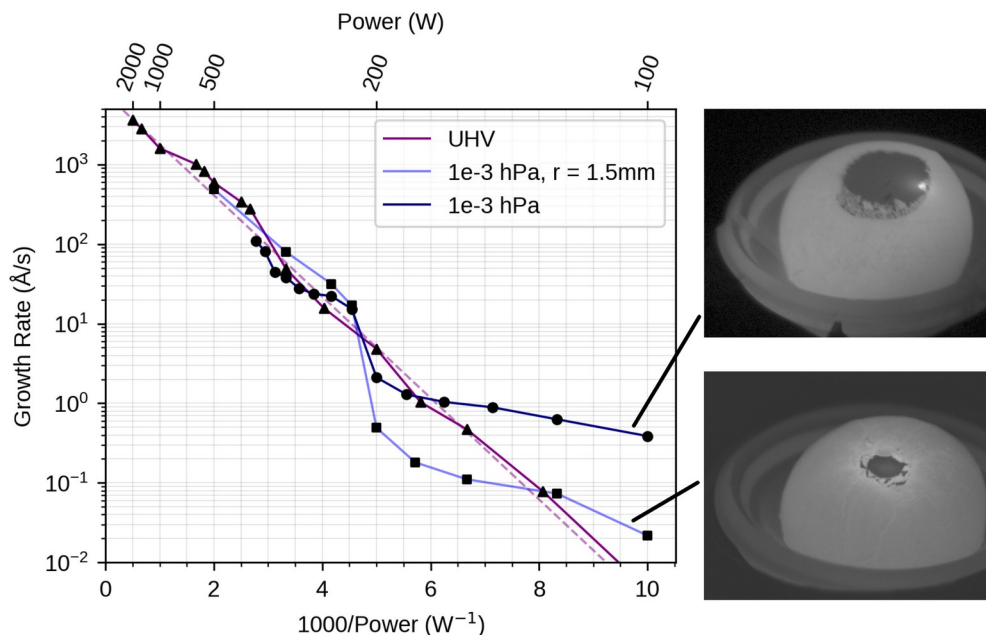

Fig. 3: Transition of Al₂O₃ growth from the ballistic to the diffusive transport regime at around 10⁻² hPa O₂ background pressure. This transition corresponds to the mean free path of the O₂ dropping below the source-sample distance of 80 mm. RT denotes deposition at room temperature, the red points show the deposition rate in the adsorption-limited homoepitaxial growth regime at a substrate temperature of 1600 °C. For details on the adsorption-limited epitaxy, refer to the submission by Felix Hensling. The very high dynamic range of TLE sources, spanning over 5 orders of magnitude in flux for a factor of 20 in laser power (see Fig. 2), combined with very rapid power modulation allows high growth rate deposition at ultrahigh quality with economic use of source material.

Electron channeling contrast imaging (ECCI) of ZnS on GaP (100) thin films at (a) 50, (b) 25, (c) 20, and (d) 15 nm shows misfit dislocations along (220) directions.

Figure 1. (a) Scanning electron microscopy (SEM) images of silica gratings and film (~ 28 nm height) show no polycrystal formation after 100 nm of 10% PSE growth of GaAs at 600°C demonstrating feature-size independent selective growth. (b) Poly-GaAs formation observed on $1.5\ \mu\text{m}$ tall gratings after same growth was performed. (c) Atomic force microscopy of respective SiO_2 surfaces indicates that increased roughness of $1.5\ \mu\text{m}$ features promotes nucleation of poly-GaAs in this growth regime.

Figure 2. (a) Root-mean-square surface roughness of SiO_2 deposited by plasma-enhanced chemical vapor deposition (PECVD) compared to HSQ planarization. (b) Atomic force microscopy of a $1.5\ \mu\text{m}$ SiO_2 film (left) before and (right) after planarization by 100 nm hydrogen silsesquioxane (HSQ) layer.

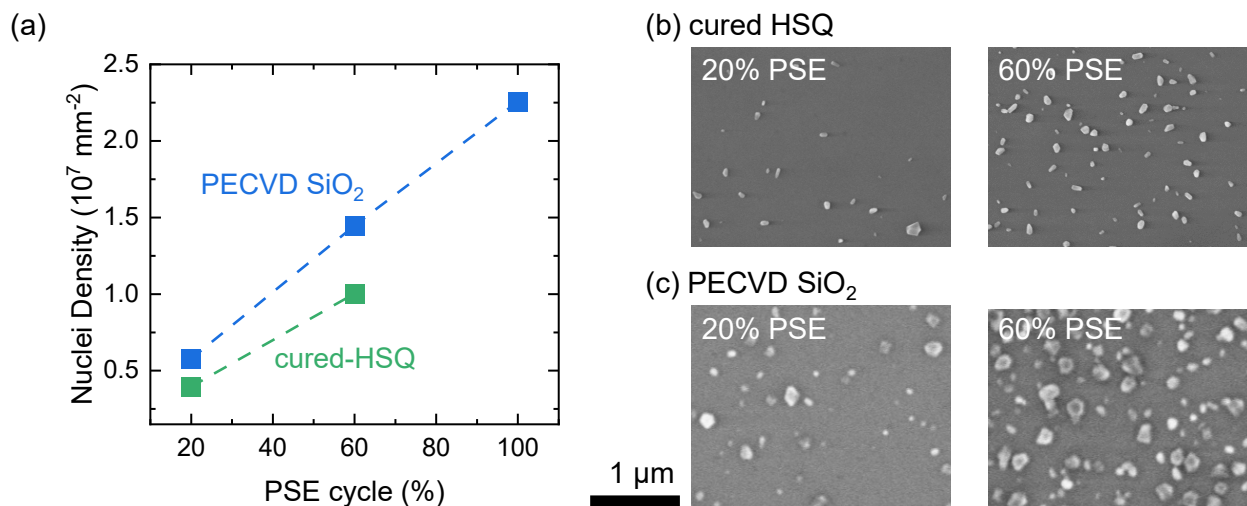

Figure 3. (a) Resulting poly-GaAs nuclei densities on cured HSQ and PECVD SiO_2 films after 100 nm GaAs was grown with varying PSE cycles ($t_{\text{cycle}} = 60$ s) at 600°C . Scanning electron microscope images of poly-GaAs on (b) cured HSQ and (c) PECVD SiO_2 .

Figure 1: Energy Dispersion X-Ray Spectroscopy (EDS) study exploring the elemental contribution of Mn, Sb and Te to the crystal structure as a function of percent of septuple layers. The black lines represent stoichiometric $(\text{MnSb}_2\text{Te}_4)_x(\text{Sb}_2\text{Te}_3)_{1-x}$. For $(\text{MnSb}_2\text{Te}_4)_x(\text{Sb}_2\text{Te}_3)_{1-x}$ samples with $0.7 < x < 0.85$ and grown with a **fast GR (red)**, Mn and Sb intermixing was observed. However for samples $(\text{MnSb}_2\text{Te}_4)_x(\text{Sb}_2\text{Te}_3)_{1-x}$ samples with $0.7 < x < 0.85$ and grown with a **slow GR (blue)**, not only, showed increased Sb and Mn intermixing, but also, some Mn and Te intermixing.

Adsorption-Controlled Growth of SrTiO₃ by Oxide MBEDylan Sotir^{1,2}, Matthew Barone^{1,2}, Darrell Schlom^{1,2,3,4}¹ Department of Materials Science and Engineering, Cornell University² Platform for the Accelerated Realization, Analysis, and Discovery of Interface Materials (PARADIM), Cornell University³ Kavli Institute at Cornell for Nanoscale Science⁴ Leibniz-Institut für Kristallzüchtung

Historically, the growth of stoichiometric SrTiO₃ by conventional molecular-beam epitaxy (MBE), utilizing elemental sources, has been challenging due to the precise calibration required. It would be useful if there were a thermodynamic regime where the composition of SrTiO₃ was self-regulating. One demonstrated way to achieve such automatic control of stoichiometry in SrTiO₃ is by supplying an excess of the volatile organometallic precursor titanium isopropoxide to grow SrTiO₃ by metalorganic MBE (MOMBE). Another means, and the one investigated here, is to stick with elemental sources but increase the substrate temperature. When SrTiO₃ is heated to high temperature, it does not evaporate congruently; rather, it loses more strontium than titanium. This difference in the vapor pressures of the volatile species suggests that adsorption-controlled growth of SrTiO₃ may be possible by conventional MBE. We report a thermodynamic window in which SrTiO₃ can be grown via adsorption control by conventional MBE. A new high-temperature laser substrate heater installed in Cornell University's PARADIM Thin Film Facility allows substrate temperatures to reach up to 2000 °C.

We show that the growth window for our highest quality adsorption-controlled SrTiO₃ is from approximately 1450-1475°C, with a Sr:Ti ratio of 5:1. All films were grown on LaAlO₃ (100) substrates. Figure 1 shows XRD data for samples grown at several temperatures including the adsorption-control window.

Figure 1: θ - 2θ x-ray diffraction scan showing approximately 33 nm thick films of SrTiO₃, grown by MBE on LaAlO₃ (100) at a range of temperature from 1350-1550 °C at a background pressure of 10% ozone of 1×10^{-6} Torr.

Supplemental to: Piezo- and flexoelectricity arising from extreme strain gradients in bent GaAs nanowires

Francisca Marin, Oliver Brandt, and Lutz Geelhaar

Paul-Drude-Institut für Festkörperelektronik, Leibniz-Institut im Forschungsverbund Berlin e.V.,
Hausvogteiplatz 5-7, 10117 Berlin, Germany

Fig. 1: Schematic illustrating the growth of bent GaAs nanowires (NWs). NWs are grown under Ga droplets, their diameter is thinned by thermal evaporation, and a lattice-matched symmetric (Al,Ga)As shell is grown for surface passivation. Last, a lattice-mismatched (Al,In)As stressor shell is grown and induces bending by strain partitioning.

Fig. 2: Low-temperature photoluminescence (PL) spectra for single straight and bent GaAs NWs with low degree of polytypism. Only the donor-acceptor pair (D^0, C^0) and the free exciton X_{hh} transition are observed. The insets are side-view micrographs of the corresponding NWs.

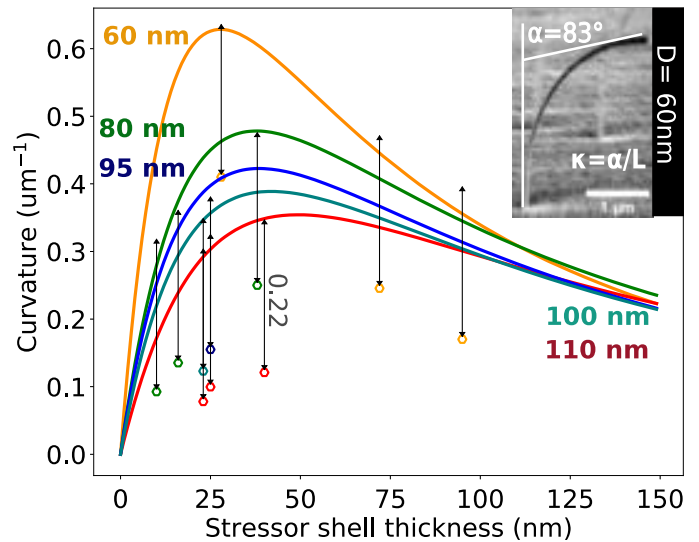

Fig. 3: NW curvature as a function of stressor shell thickness. The curves correspond to elastic strain calculations for different diameters. Data points represent experimental values, and the double arrows indicate a constant offset from the model.

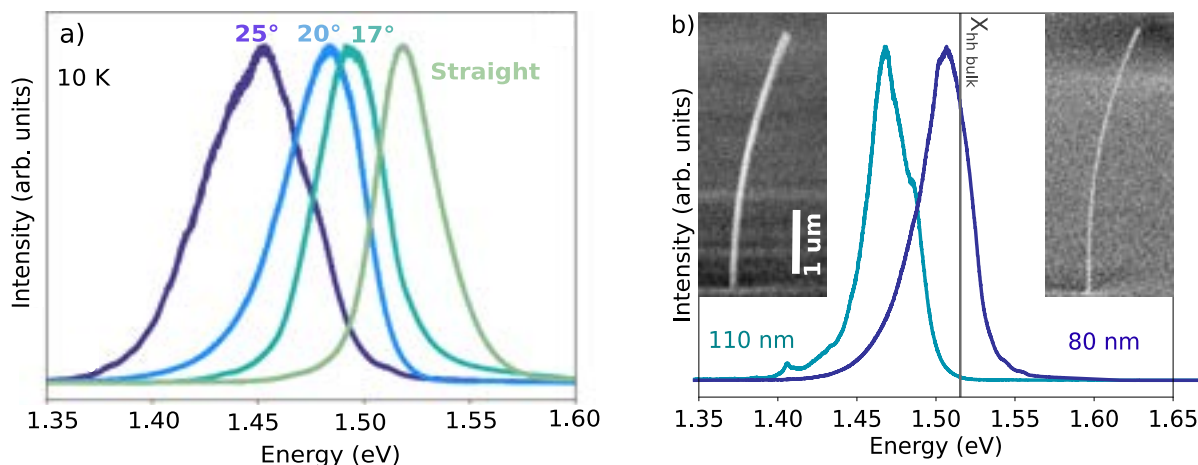

Fig. 4: Low-temperature PL spectra of single bent GaAs NWs. a) Same diameter, different curvature, as indicated by the bending angles. b) Similar curvature, different diameter as given by labels. The insets are side-view micrographs of the corresponding NWs.

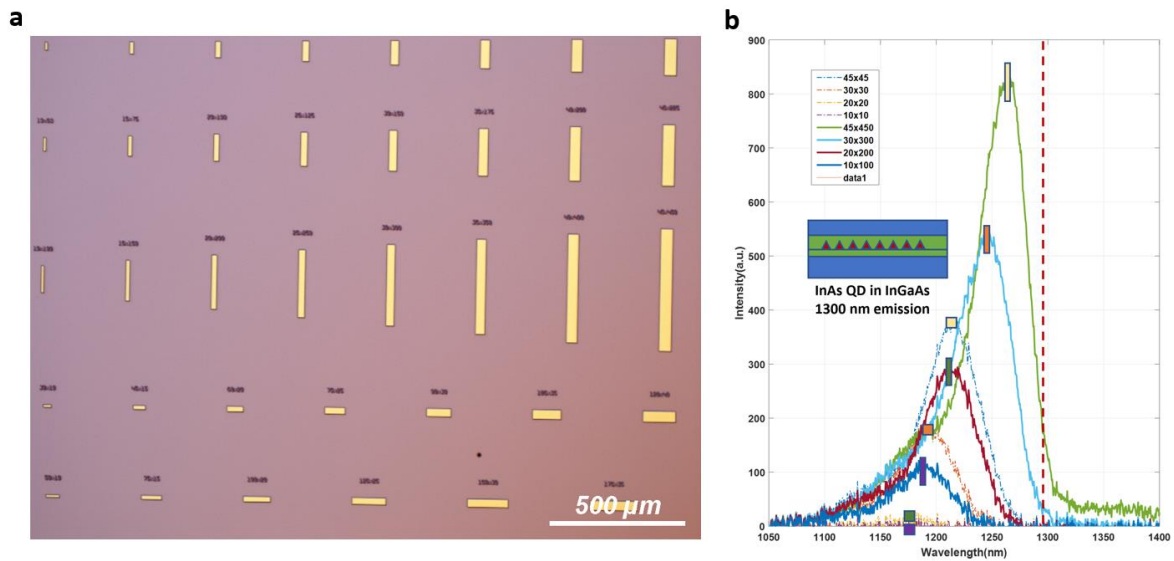

Figure 1: (a) Nomarski image of the as-fabricated oxide pattern on GaAs. The pocket size varies between $45 \mu\text{m} \times 450 \mu\text{m}$ to $1 \mu\text{m} \times 1 \mu\text{m}$. (b) Example room temperature PL spectra of the as-grown material. The legend is structured as “W×L” in micrometers. The red vertical dashed line indicates the emission wavelength of the QDs grown on planar GaAs.

Figure 2: AFM scan of the exposed surface dots. The top row indicates the widths of the pockets. Each AFM image shows a $500 \text{ nm} \times 500 \text{ nm}$ scan area. The red dashed line indicates a “boundary” between the pocket with and without observed dots.

Table 1: QD surface density (cm^{-2}) measured in pocket with various dimensions. The reference density is approximately $5 \times 10^{10} \text{ cm}^{-2}$ on planar GaAs substrate
